1 Summary

Objectives and endpoints:

Primary objective

To assess the dose-response relationship of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo as monotherapy on glycaemic control in Japanese subjects with type 2 diabetes mellitus.

Secondary objectives

To compare the safety and tolerability of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo and versus once-daily 0.9 mg liraglutide subcutaneously, all as monotherapy in Japanese subjects with type 2 diabetes mellitus.

To compare the effect of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo and versus once-daily 0.9 mg liraglutide subcutaneously, all as monotherapy on glycaemic control and body weight in Japanese subjects with type 2 diabetes mellitus.

Primary endpoint

Change from baseline to week 26 in HbA_{1c}

Key secondary endpoints

Number of treatment-emergent adverse events during exposure to trial product, assessed up to approximately 57 weeks

Number of treatment-emergent severe or blood glucose-confirmed symptomatic hypoglycaemic episodes during exposure to trial product, assessed up to approximately 57 weeks

Change from baseline to week 52 in:

- HbA_{1c}

Change from baseline to week 26 and week 52 in:

- Fasting plasma glucose
- Body weight (kg)

If a subject after week 26 and week 52 achieves (yes/no):

- HbA_{1c} < 7.0% (53 mmol/mol) (American Diabetes Association target)

Trial design:

This is a combined phase 2 dose response and phase 3 safety and efficacy trial. It is a 52-week, randomised, double-blind placebo-controlled and open-label active-controlled, parallel-group, multi-centre, single country trial with 5 treatment arms.

Japanese subjects with type 2 diabetes mellitus treated with diet and exercise therapy alone or oral anti-diabetic drug as monotherapy in addition to diet and exercise therapy will be included in this trial. Subjects will be randomised 1:1:1:1:1 manner to receive one of the following treatments:

- Oral semaglutide 3 mg once-daily
- Oral semaglutide 7 mg once-daily
- Oral semaglutide 14 mg once-daily
- Oral placebo once-daily
- Liraglutide 0.9 mg subcutaneous (s.c.) injection once-daily

The total trial duration for the individual subject will be 59 to 65 weeks depending on pre-trial treatment. The trial includes a 2-week screening period, followed by a 52-week randomised treatment period and a follow-up period of 5 weeks. For subjects treated with oral anti-diabetic drug as monotherapy prior to the screening an 8-week wash-out period will replace the 2-week screening period.

Trial population:

Number of subjects planned to be randomised: 240

Inclusion criteria

- Informed consent obtained before any trial-related activities. Trial-related activities are any procedures that are carried out as part of the trial, including activities to determine suitability for the trial.
- Japanese male or female, age above or equal to 20 years at the time of signing informed consent.
- Diagnosed with type 2 diabetes mellitus \geq 30 days prior to day of screening.
- HbA_{1c} 6.5%–9.5% (48–80 mmol/mol) (both inclusive) for subjects treated with oral anti-diabetic drug as monotherapy and 7.0%–10.0% (53–86 mmol/mol) (both inclusive) for subjects treated with diet and exercise therapy alone.
- Treatment for \geq 30 days prior to day of screening with;
 - stable daily dose of oral anti-diabetic drug as monotherapy (allowed oral anti-diabetic drugs are: metformin, sulphonylurea, glinide, α -glucosidase inhibitor, dipeptidyl peptidase-4 inhibitor and sodium-glucose cotransporter-2 inhibitor) at a half-maximum approved dose or below according to Japanese labelling in addition to diet and exercise therapy.
 - or
 - diet and exercise therapy alone.

Key Exclusion criteria

- Female who is pregnant, breast-feeding or intends to become pregnant or is of child-bearing potential and not using an adequate contraceptive method. Adequate contraceptive measures are abstinence (not having sex), diaphragm, condom (by the partner), intrauterine device, sponge, spermicide or oral contraceptives.
- Any disorder, which in the investigator's opinion might jeopardise subject's safety or compliance with the protocol.
- Family or personal history of multiple endocrine neoplasia type 2 or medullary thyroid carcinoma.
- History of pancreatitis (acute or chronic).
- History of major surgical procedures involving the stomach and potentially affecting absorption of trial product (e.g. subtotal and total gastrectomy, sleeve gastrectomy, gastric bypass surgery).
- Any of the following: myocardial infarction, stroke or hospitalisation for unstable angina or transient ischaemic attack within the past 180 days prior to the day of screening and randomisation.
- Subject presently classified as being in New York Heart Association Class IV.
- Planned coronary, carotid or peripheral artery revascularisation known on the day of screening.
- Subjects with alanine aminotransferase $> 2.5 \times$ upper normal limit.
- Renal impairment defined as estimated Glomerular Filtration Rate < 30 mL/min/1.73 m² as per Chronic Kidney Disease Epidemiology Collaboration formula.
- Treatment with once-weekly glucagon-like peptide-1 receptor agonist, once weekly dipeptidyl peptidase-4 inhibitor or thiazolidinedione in a period of 90 days before the day of screening.
- Treatment with any medication for the indication of diabetes or obesity other than stated in the inclusion criteria in a period of 60 days before the day of screening. An exception is short-term insulin treatment for acute illness for a total of ≤ 14 days.
- Proliferative retinopathy or maculopathy requiring acute treatment. Verified by fundus photography or dilated funduscopy performed within 90 days prior to randomisation.
- History or presence of malignant neoplasms within the last 5 years (except basal and squamous cell skin cancer and *in-situ* carcinomas).
- Initiation of anti-diabetic medication between the day of screening and the day of randomisation.

Key assessments:

Safety

- Adverse events
- Hypoglycaemic episodes

Efficacy

- HbA_{1c}

Footer	Description
a	Subjects treated with diet and exercise therapy alone prior to the day of screening can be randomised as soon as all inclusion and exclusion criteria are confirmed. Screening assessments should be performed up to 2 weeks prior to randomisation. The screening assessments must not exceed 3 weeks prior to randomisation (V2).
b	Subjects treated with OAD as monotherapy prior to the day of screening can be randomised after 8-week wash-out period when all inclusion and exclusion criteria are confirmed. The visit window between V1 and V2 is 8 weeks ±3 days.
c	The follow-up visit (V13) should be scheduled 5 weeks after the last date on trial product (+3 days visit window). Subjects, who have discontinued trial product prematurely, are not required to attend V13. V12A and V13A are only applicable for subjects who have discontinued trial product prematurely.
d	The phone contact (P1W) is applied only for subjects previously treated with OAD as monotherapy. Phone contact can be replaced with a visit if further examination is needed at the investigator's discretion.
e	Fundus photography/dilated funduscopy performed within 90 days prior to randomisation is acceptable if results are available for evaluation at V2, unless worsening of visual function since last examination. Fundus photography/dilated funduscopy at V12 is allowed to be performed between V11 and V12 (preferably as close to V12 as possible).

f	For women of child-bearing potential: Urine pregnancy test should also be performed at any time during the trial if a menstrual period is missed.
g	At V1 only ALT, creatinine and eGFR will be assessed as part of Biochemistry.
h	For the subjects randomised to oral semaglutide/placebo treatment only. At randomisation, the antibody sampling must be done after randomisation and before administration of first dose of trial product. For subjects who have discontinued trial product prematurely, no antibodies sampling should be done for visits occurring after V13A.
i	Adverse events reporting includes adverse events from the first trial-related activity after the subject has signed the informed consent, however, pre-existing conditions identified as a result of the screening procedures should be reported as medical history or concomitant illness.
j	For the subjects randomised to oral semaglutide/placebo treatment only. At V8 one PK sample should be taken pre-dose and one should be taken 60-90 minutes post-dose. At the other visits sample will be taken at any time during the visit. For subjects who have discontinued trial product prematurely, no PK sampling should be done for visits occurring after V13A.
k	The investigator must document that direction for use is given to the subject verbally and in writing at the first dispensing visit (V2). Direction for use should be given to the subject at subsequent visits when judged necessary by the investigator. The subjects allocated to liraglutide must be trained in how to handle the pen-injector when handed out the first time and at subsequent visits when judged necessary by the investigator.
l	Fasting for blood sampling is defined as no food or liquid within the last 8 hours prior to blood sampling, however, water is allowed up until 2 hours prior to blood sampling.

3 Background information and rationale for the trial

The trial will be conducted in compliance with this protocol, International Conference on Harmonisation (ICH) Good Clinical Practice (GCP)¹ and applicable regulatory requirements, and in accordance with the Declaration of Helsinki².

In this document, the term investigator refers to the individual responsible for the overall conduct of the clinical trial at a trial site.

3.1 Background information

For an assessment of benefits and risks of the trial, see Section [18.1](#).

3.1.1 Type 2 diabetes mellitus

Type 2 diabetes mellitus (T2DM) is a progressive metabolic disease primarily characterised by abnormal glucose metabolism. The pathogenesis is heterogeneous involving environmental, lifestyle and genetic factors leading to chronic hyperglycaemia caused by peripheral tissue insulin resistance, impaired insulin secretion due to abnormal beta-cell function and abnormal glucose metabolism in the liver³.

Optimal glycaemic control is the treatment goal in subjects with T2DM in order to prevent long-term complications associated with chronic hyperglycaemia⁴. Despite the availability of several anti-diabetic drugs, a significant proportion of subjects with T2DM do not achieve the recommended targets for glycaemic control^{5,6}.

3.1.2 Glucagon-like peptide-1

Glucagon-like peptide-1 (GLP-1) is an incretin hormone with a glucose-dependent stimulatory effect on insulin and inhibitory effect on glucagon secretion from the pancreatic islets^{7,8}. Subjects with T2DM have a decreased incretin effect^{9,10,11,12}. However, the insulinotropic action of GLP-1 and thus, the ability to lower blood glucose (BG) levels, is preserved when GLP-1 is administered at supraphysiological levels¹³. In addition, supraphysiological levels of GLP-1 induce reduction in body weight¹⁴. GLP-1 is a physiological regulator of appetite and food intake and GLP-1 receptors are present in several areas of the brain involved in appetite regulation^{15,16}. Physiologically, GLP-1 also has a pronounced inhibitory effect on gastric emptying; however this effect seems to diminish upon chronic exposure^{14,15,16}. These mechanisms of action make GLP-1 receptor agonists (GLP-1 RA) an attractive pharmacological treatment for T2DM^{17,18,19}.

3.1.3 Oral semaglutide

Semaglutide is a long-acting GLP-1 RA structurally similar to liraglutide (Victoza[®]), a once-daily GLP-1 RA developed by Novo Nordisk and approved worldwide for the treatment of T2DM. Compared to human native GLP-1, which has a short half-life, the semaglutide molecule has three

minor but important modifications ensuring protraction of its action: amino acid substitutions at position 8 (alanine to alpha-aminoisobutyric acid, a synthetic amino acid) and position 34 (lysine to arginine) and acylation of the peptide backbone with a spacer and C-18 fatty di-acid chain to lysine in position 26^{20,21}. The fatty di-acid side chain and the spacer mediate strong binding to albumin, thereby reducing renal clearance. The amino acid substitution at position 8 makes semaglutide less susceptible to degradation by dipeptidyl peptidase-4 (DPP-4). The change in position 34 from a lysine to an arginine is included to have only one lysine in the sequence where to a spacer can be attached.

Semaglutide is in development for oral once-daily treatment of T2DM. As the bioavailability of GLP-1 RAs is low when administered orally, semaglutide has been co-formulated with the absorption-enhancing excipient sodium N-[8-(2-hydroxybenzoyl) amino]caprylate (SNAC) to increase the bioavailability of semaglutide. The absorption-enhancing properties of SNAC co-formulation are based on the [REDACTED] concept developed by [REDACTED]

SNAC facilitates the absorption of semaglutide in a strictly time and size dependent manner, primarily via the transcellular route. The available data for semaglutide co-formulated with SNAC support that the absorption takes place in the stomach in a localised, buffered environment in close proximity to the tablet erosion. The absorption process is hampered if dosed with food, liquid or in the presence of significant stomach content.

The absorption enhancement requires co-formulation between semaglutide and SNAC. Throughout this document “oral semaglutide” will refer to the drug product, that is, semaglutide co-formulated with 300 mg SNAC.

3.1.4 Nonclinical data

3.1.4.1 Semaglutide

The nonclinical programme for semaglutide was designed according to the ICH M3 guideline to support the clinical development²². The standard nonclinical data package required to support phase 3 clinical trials has been completed. In addition, 2-year carcinogenicity studies and a pre- and postnatal development toxicity study have been completed. Semaglutide was generally well tolerated in animals (mice, rats and cynomolgus monkeys). Two potential safety issues have been identified and these are detailed below.

Thyroid C-cell tumours in rodents

Treatment-related non-genotoxic proliferative changes in the thyroid C-cells of mice and rats were observed in 2-year carcinogenicity studies with semaglutide; thyroid hyperplasia was preceded by an increase in serum calcitonin. C-cell changes have not been observed in long-term studies in non-human primate. The observed pattern of effects in mice and rats and lack of these effects in the non-human primate and in man suggest that the mechanism by which semaglutide acts on the thyroid C-

cells in rodents is the same as has been demonstrated for other GLP-1 RAs, including liraglutide. According to this mechanism, C-cell hyperplasia is mediated by the GLP-1 receptor and is not associated with RET (re-arranged during transfection) gene activation and rodents appear to be particularly sensitive, whereas humans are not. The relevance for human subjects is currently unknown, but considered to be low²³.

Embryo–foetal development toxicity

Semaglutide caused embryo-foetal development toxicity in the rat through a GLP-1 receptor mediated effect on the inverted yolk sac placenta leading to impaired nutrient supply to the developing embryo. Primates do not have an inverted yolk sac placenta which makes this mechanism unlikely to be of relevance to humans and cynomolgus monkeys. In the developmental toxicity studies in cynomolgus monkey, a marked maternal body weight loss associated with the pharmacological effect of semaglutide coincided with increased early foetal loss; however, there was no indication of a teratogenic potential of semaglutide in this species.

A review of the results from the nonclinical studies can be found in the investigator’s brochure (IB) for semaglutide (subcutaneous administration), edition 11²⁴ and the IB for oral administration of semaglutide (NN9924), edition 7²⁵, or any updates of these documents.

3.1.4.2 SNAC

SNAC was developed as an absorption-enhancing excipient for the oral route of administration. The nonclinical programme to support clinical phase 3 development and marketing authorisation application submission has been conducted including a 26-week carcinogenicity study in transgenic rasH2 mice and a 2-year carcinogenicity study in Sprague-Dawley rats.

Measurements of lactate levels have been included at selected time points around peak concentrations of SNAC in two of the phase 3a trials in the PIONEER programme (PIONEER 1 and 2) with the intention to document that SNAC does not impair cellular respiration in humans. In addition, events of lactic acidosis must be reported as an AE requiring additional data collection, please refer to Section [8.4.1.2](#), Section [12.1.5](#) and appendix B.

The carcinogenicity studies demonstrated that SNAC was not carcinogenic to the transgenic rasH2 mouse or the Sprague-Dawley rat. The doses tested covered total exposures of SNAC in plasma (in terms of area under the curve [AUC]) of 2-fold in the mouse and up to 44-fold in the rat when compared to the mean total exposure of SNAC in humans following a clinical dose of 300 mg SNAC/day.

A review of the SNAC results from the nonclinical studies can be found in the IB for oral administration of semaglutide (NN9924), edition 7²⁵, or any updates hereof.

3.1.5 Clinical data for oral semaglutide

A comprehensive clinical pharmacology programme including 12 trials has been completed, as well as a 26-week phase 2 dose-finding trial involving more than 600 subjects with T2DM.

For details on the individual trials, please see the IB for oral administration of semaglutide (NN9924) edition 7²⁵, or any updates hereof.

3.1.5.1 Pharmacokinetics

In the multiple-dose trial (NN9924-3991), oral semaglutide has demonstrated a long mean terminal half-life ($t_{1/2}$) ranging from 153 to 161 hours (~1 week) and a median time to reach maximum observed concentration (t_{max}) ranging from 1 to 2 hours in healthy subjects.

In multiple-dose pharmacokinetics (PK) trials, the exposure to oral semaglutide increased with increasing dose. Overall, the pharmacokinetic properties of semaglutide appeared similar in healthy subjects and in subjects with T2DM.

Exposure to semaglutide exhibits a substantially greater dose-to-dose variation following oral administration compared to subcutaneous (s.c.) administration. However, when administered orally once-daily the PK properties of semaglutide, i.e. low clearance and long half-life, will limit the variation in exposure at steady state.

Data obtained following investigation of different dosing conditions for oral semaglutide have demonstrated that subjects should take the oral semaglutide tablet in the morning in a fasting state and at least 30 minutes before the first meal of the day.

[REDACTED]

[REDACTED]

In subjects with mild to severe hepatic impairment, the exposure to semaglutide appeared to be unaffected by the degree of hepatic impairment, whereas the exposure to SNAC (in terms of both AUC and C_{max}) was increased for subjects with hepatic impairment as compared to subjects with normal hepatic function.

All tablets of oral semaglutide contain 300 mg of SNAC regardless of the semaglutide dose. SNAC is rapidly absorbed with a median t_{max} ranging from 0.35–0.5 hours in healthy subjects and from 0.52–1.43 hours in subjects with T2DM. It is extensively metabolised and no accumulation of SNAC has been observed in clinical trials.

3.1.5.2 Efficacy

The efficacy of oral semaglutide in adult subjects with T2DM was investigated in a 26-week phase 2 dose-finding trial (NN9924-3790). In this trial, placebo or one of the following doses of oral semaglutide were administered once daily: 2.5, 5, 10, 20 and 40 mg.

Results from the trial showed that oral semaglutide effectively lowered glycosylated haemoglobin (HbA_{1c}) and body weight. Placebo-adjusted reductions in HbA_{1c} were dose-dependent and statistically significant for all oral semaglutide treatment arms at week 26 (range: -0.40% to -1.59%). Placebo-adjusted reductions in body weight were dose-dependent and statistically significant for oral semaglutide treatment doses of 10 mg and above at week 26 (range: -3.61 kg to -6.98 kg).

3.1.5.3 Safety

In the clinical trials completed so far, no unexpected safety findings have been identified for oral semaglutide administered up to 40 mg once daily. Consistent with other GLP-1 RAs, commonly reported adverse events (AEs) included nausea and vomiting, most of which were mild to moderate in severity. In line with findings for other GLP-1 RAs, an increase in heart rate and serum levels of lipase and amylase has also been observed in subjects exposed to oral semaglutide.

In addition to the 13 completed clinical trials with oral semaglutide, SNAC has been investigated in the programme of orally administered heparin in combination with SNAC (heparin/SNAC). The heparin/SNAC programme ([REDACTED]) included 29 phase 1 trials (SNAC doses ranged from 0.172-10.5 g). In three of these trials, SNAC alone was investigated (to a maximum

dose of 10.5 g). The trials covered formulation development, food effect, hepatic and renal impairment, age-effect and drug-drug interaction. The programme also included a total of three phase 2 and 3 trials in which the effects of orally delivered heparin solution (with >1.5 g SNAC three times a day) was investigated. The overall safety profile of oral semaglutide and heparin/SNAC indicates that SNAC is safe and well-tolerated.

For further details, please see the IB for oral administration of semaglutide (NN9924) edition 7²⁵, or any updates hereof.

3.1.6 Liraglutide

The selected active comparator in this trial is liraglutide, an injectable GLP-1 RA approved for once-daily administration. Liraglutide was developed by Novo Nordisk and approved in 2009 in the EU, in 2010 in Japan, and in 2010 in the US under the trade name Victoza[®] to improve glycaemic control in adults with T2DM.

For further details, please see the current approved label for liraglutide (Victoza[®]) in Japan²⁶.

3.2 Rationale for the trial

Many patients with T2DM are not in glycaemic control with the currently marketed oral anti-diabetic drugs (OADs). Nevertheless, treatment with more efficacious injectable therapies such as GLP-1 RAs and insulin are rarely added during the early stages of the disease. Oral semaglutide is the first GLP-1 RA in development in a tablet formulation and it has the potential of becoming a new attractive treatment option early in the treatment cascade due to its effects on both hyperglycaemia and body weight.

"The "Draft Guideline for Clinical Evaluation of Hypoglycaemic Agents"²⁷ (hereafter, draft AD guideline) provided by the Ministry of Health, Labour and Welfare (MHLW), Japan, specifies that in order to obtain the indication "T2DM" the investigational drug must be evaluated in a phase 2 study in Japanese patients with T2DM evaluating the efficacy, safety and dosage regimen as well as the dose-response relationship of the glucose-lowering effect. In addition, the "long-term" safety and efficacy of an investigational drug should be confirmed in monotherapy in a sufficient number of Japanese patients.

The rationale for this trial is to assess the dose-response relationship of the glucose-lowering effect of oral semaglutide after 6 months and to evaluate the long-term safety and efficacy of oral semaglutide compared to placebo and liraglutide as monotherapy after 12 months of treatments.

4 Objectives and endpoints

4.1 Objectives

4.1.1 Primary objective

To assess the dose-response relationship of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo as monotherapy on glycaemic control in Japanese subjects with type 2 diabetes mellitus.

4.1.2 Secondary objectives

To compare the safety and tolerability of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo and versus once-daily 0.9 mg liraglutide subcutaneously, all as monotherapy in Japanese subjects with type 2 diabetes mellitus.

To compare the effect of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo and versus once-daily 0.9 mg liraglutide subcutaneously, all as monotherapy on glycaemic control and body weight in Japanese subjects with type 2 diabetes mellitus.

4.2 Endpoints

Baseline refers to randomisation, and week 26 and week 52 refer to 26 weeks after randomisation and 52 weeks after randomisation respectively.

4.2.1 Primary endpoint

Change from baseline to week 26 in HbA_{1c}

4.2.2 Secondary endpoints

4.2.2.1 Confirmatory secondary endpoints

Not applicable.

4.2.2.2 Supportive secondary endpoints

Key supportive secondary endpoints prospectively selected for disclosure (e.g. Clinical Trials Information/JapicCTI site: clinicaltrials.jp and clinicaltrials.gov) are marked with an asterisk (*).

Supportive secondary safety endpoints

Number of treatment-emergent adverse events (TEAEs) during exposure to trial product, assessed up to approximately 57 weeks*

Number of treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes during exposure to trial product, assessed up to approximately 57 weeks*

Treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes during exposure to trial product, assessed up to approximately 57 weeks (yes/no)

Change from baseline to week 26 and 52 in:

- Haematology
- Biochemistry
- Calcitonin
- Pulse
- Systolic blood pressure
- Diastolic blood pressure
- Electrocardiogram (ECG) category
- Physical examination

Change from baseline to week 52 in:

- Fundus photography/dilated fundoscopy

Occurrence of anti-semaglutide antibodies (yes/no):

- Anti-semaglutide binding antibodies
- Anti-semaglutide neutralising antibodies
- Anti-semaglutide binding antibodies cross reacting with native GLP-1
- Anti-semaglutide neutralising antibodies cross reacting with native GLP-1

Anti-semaglutide antibodies:

- Anti-semaglutide binding antibody levels

Supportive secondary efficacy endpoints

Change from baseline to week 26 and 52 in:

- HbA_{1c} (only week 52)*
- Fasting plasma glucose (FPG)*
- 7-point self-measured plasma glucose (SMPG) profile
 - Mean 7-point profile
 - Mean postprandial increment over all meals
- Body weight (kg)*
- Body weight (%)
- Body mass index (BMI)
- Waist circumference

- Fasting lipid profile (total cholesterol, low-density lipoprotein [LDL] cholesterol, high-density lipoprotein [HDL] cholesterol and triglycerides, very low density lipoprotein [VLDL], free fatty acids)
- Fasting insulin, C-peptide, glucagon, pro-insulin
- Pro-insulin/insulin ratio
- Insulin resistance (homeostatic model assessment index of insulin resistance [HOMA-IR])
- Beta-cell function (homeostatic model assessment index of beta-cell function [HOMA-B])
- Patient-reported outcomes (PROs)
 - Short Form (SF)-36v2TM (acute version) health survey
 - Diabetes Therapy-Related QOL (DTR-QOL) questionnaire

If a subject after week 26 and week 52 achieves (yes/no):

- HbA_{1c} <7.0% (53 mmol/mol) (American Diabetes Association [ADA] target)*
- HbA_{1c} ≤6.5% (48 mmol/mol) (American Association of Clinical Endocrinologists [AACE] target)
- HbA_{1c} reduction ≥1%-point (10.9 mmol/mol)
- Body weight loss ≥3%
- Body weight loss ≥5%
- Body weight loss ≥10%
- HbA_{1c} <7.0% (53 mmol/mol) without hypoglycaemia (treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes) and no body weight gain
- HbA_{1c} reduction ≥1%-point (10.9 mmol/mol) and body weight loss ≥3%

Time to event:

- Time to rescue medication

Supportive secondary pharmacokinetic endpoints

- Semaglutide plasma concentrations for population PK analysis

5 Trial design

5.1 Type of trial

This is a combined phase 2 dose-response and phase 3 safety and efficacy trial. It is a 52-week, randomised double-blind placebo-controlled and open-label active-controlled, parallel-group, multi-centre, single country trial with 5 treatment arms in Japanese subjects with T2DM to:

- assess dose-response relationship of once-daily dosing of 3 dose levels of oral semaglutide (3, 7 and 14 mg) versus placebo on glycaemic control at week 26
- compare the safety and efficacy of once-daily dosing of 3 dose levels of oral semaglutide (3, 7 or 14 mg) versus placebo and versus once-daily 0.9 mg liraglutide subcutaneously at week 26 and week 52

Japanese subjects with T2DM treated with diet and exercise therapy alone or OAD as monotherapy (half maximum approved dose or below) in addition to diet and exercise therapy will be included in this trial. For subjects treated with OAD as monotherapy, pre-trial OAD will be discontinued at screening and washed-out before randomisation. Subjects treated with diet and exercise therapy alone will be randomised without a wash-out period after their eligibility has been confirmed. Subjects will be randomised in a 1:1:1:1:1 manner to receive one of the following treatments:

- Oral semaglutide 3 mg once-daily
- Oral semaglutide 7 mg once-daily
- Oral semaglutide 14 mg once-daily
- Oral placebo once-daily
- Liraglutide 0.9 mg subcutaneous (s.c.) injection once-daily

Randomisation will be stratified based on:

- pre-trial OAD treatment at screening (yes/no)

The trial is double-blinded with regard to dose levels of oral semaglutide and placebo. In order to maintain the blinding of the trial for oral semaglutide and placebo all tablets containing oral semaglutide or placebo are identical with regards to visual appearance.

The treatment administration of liraglutide will be open-label.

The total trial duration for the individual subject will be 59 to 65 weeks depending on pre-trial treatment. The trial includes a 2-week screening period, followed by a 52-week randomised treatment period and a follow-up period of 5 weeks. For subjects treated with OAD as monotherapy prior to the screening an 8-week wash-out period including the screening period will replace the 2-week screening period.

A schematic illustration of the trial design is shown in [Figure 5–1](#).

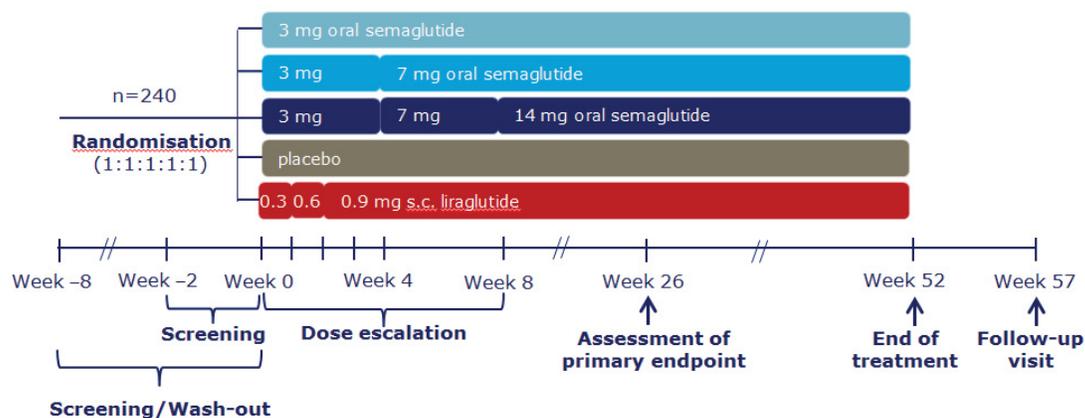

Figure 5-1 Trial design

5.2 Rationale for trial design

The trial was designed in accordance with the draft AD guideline²⁷ and is in accordance with the advice of Pharmaceuticals and Medical Devices Agency (PMDA) obtained at the End of Phase 2 meeting.

The number of subjects has been set based on the agreement with PMDA and is considered adequate to evaluate the dose-response relationship of once-daily dosing of three dose levels (3, 7 and 14 mg) of oral semaglutide versus placebo as monotherapy on glycaemic control.

The parallel treatment groups, a randomised (double-blind/open-label) design have been chosen to assess the dose-response relationship, long-term safety and efficacy of oral semaglutide compared to placebo and active comparator liraglutide. Randomisation will be stratified based on pre-trial OAD treatment at screening (yes/no) to ensure even distribution of the 5 treatment arms within each stratum.

There will be strict rescue criteria in place to ensure acceptable glycaemic control during the trial for all treatment arms, including the placebo arm.

The treatment duration will be 52 weeks for the assessment of long-term safety of oral semaglutide as monotherapy in accordance with the draft AD guideline. The dose-response relationship will be evaluated based on data at week 26. No interim analysis will be done and the blinding will remain throughout the trial.

The follow-up period is 5 weeks to allow for wash-out of semaglutide and to prevent interference in the antibody assay.

5.3 Treatment of subjects

Treatment of subjects is summarised in [Table 5-1](#).

Oral semaglutide treatment arms

Oral semaglutide is a long-acting GLP-1 RA to be administered orally once-daily. All subjects randomised to oral semaglutide will initiate treatment with 3 mg once-daily. Subjects randomised to a treatment dose of 7 and 14 mg, will follow a fixed dose escalation regimen with 4 weeks between the dose escalation steps. The maintenance dose of 7 mg once-daily will be reached after 4 weeks on 3 mg once daily. The maintenance dose of 14 mg once-daily will be reached after 4 weeks on 3 mg, followed by 4 weeks on 7 mg once daily ([Table 5-1](#)). All dose levels, including the dose-escalation, will be blinded. To mitigate the risk of gastrointestinal AEs, it is important to follow the fixed 4-week dose escalation intervals. The dose must not be changed once the randomised dose of oral semaglutide has been reached.

Placebo treatment

Treatment with placebo tablets will follow the same rules for oral semaglutide treatment outlined above.

Liraglutide treatment

Treatment with liraglutide injections will be initiated at 0.3 mg once-daily. The dose will be escalated weekly, first to 0.6 mg once-daily and then to the recommended maximum dose of 0.9 mg once-daily according to the approved label in T2DM in Japan²⁶. To mitigate the risk of gastrointestinal AEs, it is important to follow the weekly dose escalation intervals. The dose must not be changed during the course of the trial once the 0.9 mg maintenance dose of liraglutide has been reached.

Table 5–1 Overview of treatment of subjects

Trial periods		Screening	Treatment			Follow-up
First visits in each period		Visit 1	Visit 2	Visit 4	Visit 5	Visit 13
Duration of each period		Up to 2 weeks ^a	4 weeks	4 weeks	44 weeks	5 weeks
		8 weeks ^b				
Treatment arm	N					
Oral semaglutide 3 mg	48	Screening	3 mg	3 mg	3 mg	Follow-up
Oral semaglutide 7 mg	48	Screening	3 mg	7 mg	7 mg	Follow-up
Oral semaglutide 14 mg	48	Screening	3 mg	7 mg	14 mg	Follow-up
Placebo	48	Screening	placebo	placebo	placebo	Follow-up
Liraglutide 0.9 mg	48	Screening	0.3 mg (0.05 mL) liraglutide injection with weekly dose escalation to 0.6 mg (0.1 mL) and 0.9 mg (0.15 mL)	0.9 mg	0.9 mg	Follow-up

^a Subject treated with diet and exercise therapy alone prior to the day of screening can be randomised as soon as all inclusion and exclusion criteria are confirmed.

^b Subjects treated with OAD as monotherapy prior to the day of screening can be randomised after 8-week wash-out period when all inclusion and exclusion criteria are confirmed.

5.3.1 Dosing instructions

Oral semaglutide/placebo dosing

Absorption of oral semaglutide is significantly affected by food and fluid in the stomach, hence dosing should be once-daily in the morning in a fasting state and at least 30 minutes before the first meal of the day. The tablet can be taken with up to half a glass of water (approximately 120 mL). The tablet must be swallowed whole by the subject and must not be broken or chewed (see [Table 9–2](#)). Furthermore, other oral medication can be taken 30 minutes after administration of the oral trial product.

Liraglutide dosing

Liraglutide should be administered once-daily in the morning or evening at a fixed time and irrespective of meals. Liraglutide is injected subcutaneously in the abdomen, the thigh or the upper arm. The injection site should be changed at every injection and about 2–3 cm apart from the previous one.

5.3.2 Background medication

As this trial is a monotherapy trial, there are no background anti-diabetic medications after the screening.

Please see section [6.4](#) with regards to rescue medication.

5.4 Treatment after discontinuation of trial product

When discontinuing trial products, either at the scheduled end of treatment visit (see Section [8.1.5](#)) or if trial product is discontinued prematurely (see Section [8.1.6](#)), the subject should be switched to a suitable marketed product at the discretion of the investigator. For subjects randomised to oral semaglutide/placebo treatment only, after discontinuation of trial products, GLP-1 RAs are not allowed before completion of the follow-up visit 5 weeks after the last date on trial products (to avoid interference with the antibody assay for semaglutide). Throughout the protocol, last date on trial product is defined as date of the subject's last dosage of trial product.

As this trial is a phase 2/3a trial, oral semaglutide will not be available for prescription until after marketing authorisation.

5.5 Rationale for treatment

For oral semaglutide, the three dose levels (3, 7 and 14 mg), treatment initiation with the lowest dose and the 4-week dose escalation steps have been chosen based on data from the global phase 2 dose-finding trial. This regime is expected to have the optimal benefit-risk profile for further development for treatment of T2DM in the PIONEER programme.

Liraglutide has been chosen as active comparator since it is a well-established injectable GLP-1 RA once-daily dosing. Treatment will be initiated at 0.3 mg once-daily in accordance with the current, approved label in Japan. Liraglutide will be dose escalated to the highest approved maintenance dose in Japan (0.9 mg) to compare all 3 dose levels of oral semaglutide with maximum dose of liraglutide as monotherapy in terms of efficacy and safety.

The duration of randomised treatments is considered adequate to collect sufficient data on efficacy and safety in accordance with the trial objectives.

6 Trial population

6.1 Number of subjects

Number of subjects planned to be screened: 300

Number of subjects planned to be randomised: 240

Number of subjects expected to complete the trial on or off randomised trial product: 216

6.2 Inclusion criteria

For an eligible subject, all inclusion criteria must be answered “yes”.

1. Informed consent obtained before any trial-related activities. Trial-related activities are any procedures that are carried out as part of the trial, including activities to determine suitability for the trial.
2. Japanese male or female, age above or equal to 20 years at the time of signing informed consent.
3. Diagnosed with type 2 diabetes mellitus \geq 30 days prior to day of screening.
4. HbA_{1c} 6.5%–9.5% (48–80 mmol/mol) (both inclusive) for subjects treated with OAD as monotherapy and 7.0%–10.0% (53–86 mmol/mol) (both inclusive) for subjects treated with diet and exercise therapy alone.
5. Treatment for \geq 30 days prior to day of screening with;
 - stable daily dose of OAD as monotherapy (allowed OADs are: metformin, sulphonylurea [SU], glinide, α -glucosidase inhibitor [α -GI], dipeptidyl peptidase-4 [DPP-4] inhibitor and sodium-glucose cotransporter-2 [SGLT-2] inhibitor) at a half-maximum approved dose or below according to Japanese labelling in addition to diet and exercise therapy.
 - or
 - diet and exercise therapy alone.

6.3 Exclusion criteria

For an eligible subject, all exclusion criteria must be answered “no”.

1. Known or suspected hypersensitivity to trial product(s) or related products.
2. Previous participation in this trial. Participation is defined as signed informed consent.
3. Female who is pregnant, breast-feeding or intends to become pregnant or is of child-bearing potential and not using an adequate contraceptive method. Adequate contraceptive measures are abstinence (not having sex), diaphragm, condom (by the partner), intrauterine device, sponge, spermicide or oral contraceptives.
4. Receipt of any investigational medicinal product within 90 days before screening.

5. Any disorder, which in the investigator's opinion might jeopardise subject's safety or compliance with the protocol.
6. Family or personal history of multiple endocrine neoplasia type 2 (MEN 2) or medullary thyroid carcinoma (MTC).
7. History of pancreatitis (acute or chronic)
8. History of major surgical procedures involving the stomach potentially affecting absorption of trial product (e.g. subtotal and total gastrectomy, sleeve gastrectomy, gastric bypass surgery).
9. Any of the following: myocardial infarction, stroke or hospitalisation for unstable angina or transient ischaemic attack within the past 180 days prior to the day of screening and randomisation.
10. Subjects presently classified as being in New York Heart Association (NYHA) Class IV.
11. Planned coronary, carotid or peripheral artery revascularisation known on the day of screening.
12. Subjects with alanine aminotransferase (ALT) > 2.5 x upper normal limit (UNL).
13. Renal impairment defined as estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73 m² as per Chronic Kidney Disease Epidemiology Collaboration formula (CKD-EPI).
14. Treatment with once-weekly glucagon-like peptide-1 receptor agonist (GLP-1 RA), once weekly dipeptidyl peptidase-4 (DPP-4) inhibitor or thiazolidinedione in a period of 90 days before the day of screening
15. Treatment with any medication for the indication of diabetes or obesity other than stated in the inclusion criteria in a period of 60 days before the day of screening. An exception is short-term insulin treatment for acute illness for a total of ≤ 14 days.
16. Proliferative retinopathy or maculopathy requiring acute treatment. Verified by fundus photography or dilated funduscopy performed within 90 days prior to randomisation.
17. History or presence of malignant neoplasms within the last 5 years (except basal and squamous cell skin cancer and *in-situ* carcinomas).
18. Initiation of anti-diabetic medication between the day of screening and the day of randomisation.

6.4 Rescue criteria

Subjects with persistent and unacceptable hyperglycaemia should be offered treatment intensification. To allow time for dose escalation to maximum dose and to observe the expected effect of treatment on glycaemic parameters, rescue criteria will be applied from week 8 and onwards. If any of the FPG values (including fasting SMPG) exceed the limits outlined below and no intercurrent cause of the hyperglycaemia can be identified, a confirmatory FPG (at central laboratory) should be obtained by calling the subject for a re-test. If the confirmatory FPG also exceeds the value described below, the subject should be offered rescue medication (initiation of new anti-diabetic medication):

- 13.3 mmol/L (240 mg/dL) from week 8 to end of week 13
- 11.1 mmol/L (200 mg/dL) from week 14 to end of treatment

In addition, subject should be offered rescue medication if:

- HbA_{1c} (at central laboratory) >8.5% (69.4 mmol/mol) from week 26 to end of treatment.

It is important for trial integrity that only subjects actually needing treatment intensification (as defined above) are started on rescue medication. Subjects that are started on rescue medication should continue to follow the protocol-specified visit schedule. Rescue medication should be prescribed at investigator's discretion as add-on to randomised treatment and according to clinical practice in Japan or ADA/European Association for the Study of Diabetes guidelines^{28,29} (excluding GLP-1 RAs, DPP-4 inhibitors and amylin analogues).

If a subject experience persistent decline in renal function after starting rescue medication, the treatment with the rescue medication should be adjusted/discontinued according to the current approved label or guideline.

Rescue medication and any changes hereto should be captured on the concomitant medication form in the electronic case report form (eCRF) (see section [8.2.4](#))

Rescue medication is considered to be non-investigational medicinal product (NIMP) and will not be provided by Novo Nordisk A/S.

6.5 Criteria for premature discontinuation of trial product

All efforts should be made to keep the subject on trial product. However, the subject may be prematurely discontinued from trial product at the discretion of the investigator due to a safety concern. For additional guidance, refer to appendix B.

The subject must be prematurely discontinued from trial product if the following applies:

1. Safety concern related to trial product or unacceptable intolerability
2. Included in the trial in violation of the inclusion and/or exclusion criteria
3. Pregnancy
4. Intention of becoming pregnant
5. Simultaneous participation in another clinical trial of an approved or non-approved investigational medicinal product.
6. Calcitonin \geq 100 ng/L

If a criterion for premature discontinuation of trial product is met, trial product should not be re-initiated but subjects should continue with the scheduled site contacts.

See Section [8.1.6](#) for procedures to be performed for subjects discontinuing trial product prematurely.

6.6 Withdrawal from trial

The subject may withdraw consent at will at any time. The subject's request to withdraw from the trial must always be respected. Only subjects who withdraw consent should be considered as withdrawn from trial.

See Section [8.1.7](#) for procedures to be performed for subjects withdrawing consent.

6.7 Subject replacement

Subjects who withdraw consent or discontinue trial product prematurely will not be replaced.

6.8 Rationale for trial population

The trial population will include Japanese subjects with T2DM treated with diet and exercise therapy alone or a stable dose of one OAD as monotherapy in addition to diet and exercise for at least 30 days prior to screening. As the pre-trial OAD will be washed out before randomisation, only subjects treated with a OAD at half-maximum approved dose or below can be included in the trial. The HbA_{1c} limits are between 6.5% and 9.5% for subjects treated with OAD as monotherapy and 7.0% and 10.0% for subjects treated with diet and exercise therapy alone. The limits of HbA_{1c} have been chosen, in order to include subjects needing intensification of anti-diabetic treatment. As it is expected that HbA_{1c} will increase after discontinuation of the pre-trial OAD a lower HbA_{1c} level will be applied for subjects treated with OAD as monotherapy. The upper limit will secure that subjects with severely dysregulated T2DM are not enrolled in this placebo controlled trial. In addition, FPG and HbA_{1c} will be monitored throughout the trial and rescue medication should be initiated in subjects with persistent, unacceptable hyperglycaemia. No BMI or blood pressure restrictions will be applied. Subjects with liver test abnormalities (ALT>2.5 x UNL) will be excluded to avoid potential confounding of liver safety assessments. In addition, subjects with severe and end-stage renal impairment will be excluded due to restrictions in the label of the comparator, liraglutide. Overall, the eligibility criteria allow for enrolment of a relatively broad trial population resembling the target population in common practice. Finally, the trial population was selected on the basis of the draft AD guideline²⁷ and the advice from PMDA.

7 Milestones

Planned duration of recruitment period (first subject first visit [FSFV] – last subject first visit [LSFV]):	20 weeks
Planned FSFV:	10-Jan-2017
Planned last subject last visit (LSLV):	11-Sep-2018
End of trial is defined as:	LSLV

Recruitment:

The screening and randomisation rate will be followed closely via the IWRS in order to estimate when to stop screening. All investigators will be notified immediately when the recruitment period ends, after which no further subjects may be screened and the IWRS will be closed for further screening. All subjects screened during the recruitment period and found eligible for randomisation can be randomised within the timelines specified in the flow chart (see Section 2).

Trial registration:

Information of the trial will be disclosed at clinicaltrials.gov, novonordisk-trials.com, and the Clinical Trials Information JapicCTI site clinicaltrials.jp. According to the Novo Nordisk Code of Conduct for Clinical Trial Disclosure³⁰, it will also be disclosed according to other applicable requirements such as those of the International Committee of Medical Journal Editors (ICMJE)³¹, the Food and Drug Administration Amendment Act (FDAAA)³², European Commission Requirements^{33,34} and other relevant recommendations or regulations. If a subject requests to be included in the trial via the Novo Nordisk e-mail contact at these web sites, Novo Nordisk may disclose the investigator's contact details to the subject. As a result of increasing requirements for transparency, some countries require public disclosure of investigator names and their affiliations.

8 Methods and assessments

8.1 Visit procedures

The following sections describe the assessments and procedures. These are also included in the flow chart (see Section [2](#)).

Informed consent must be obtained before any trial related activity, see Section [18.2](#).

Refer to flowchart (Section [2](#)) for number and timing of visits and specific assessments to be performed.

Each subject will attend 12 site visits and 1 or 2 phone contacts. It is the responsibility of the investigator to ensure that all site visits and phone contacts occur according to the flow chart.

Planned visits can be conducted and re-scheduled within the allowed visit window. If a visit is missed and it is not possible to re-schedule, every effort should be made to ensure information is collected at a telephone contact (within the visit window) and entered into the eCRF. Subjects will be invited for the next scheduled visit according to the visit schedule.

The investigator must keep a subject screening log, a subject identification code list and a subject enrolment log. Only subjects who have signed the informed consent form should be included on the logs. The subject screening log and subject enrolment log may be combined in one log.

The investigator must keep a log of staff and a delegation of task(s) list at site. Investigator must sign the log of staff and the delegation of task(s) at site prior to the delegation of tasks.

8.1.1 Screening, visit 1

At screening, subjects will be provided with a card stating that they are participating in a trial and giving contact address(es) and telephone number(s) of relevant trial site staff. Subjects should be instructed to return the card to the investigator at the last trial visit or to destroy the card after the last visit.

A screening session must be made in the IWRS. Each subject will be assigned a unique 6-digit subject number which will remain the same throughout the trial.

Once all data relating to V1 have been obtained, these must be reviewed, dated and signed by the investigator and/or documented in medical records to assess that the subject is eligible to continue in the trial.

If any untoward medical occurrence that might have worsened the renal or hepatic function from screening to randomisation, the investigator should reconsider the subject's eligibility.

Wash-out period for subjects previously treated with OAD as monotherapy:

For subjects previously treated with OAD as monotherapy, their pre-trial OAD will be washed out for 8 weeks before Visit 2.

During the wash-out period, the subjects should measure pre-breakfast SMPG (fasting for at least 6 hours) at least twice a week and if they experience hyperglycaemic symptoms. The subjects should record the SMPG values measured in the diary.

If pre-breakfast SMPG (fasting state) is above 240 mg/dL (13.3 mmol/L) or postprandial SMPG, if measured, is above 270 mg/dL (15.0 mmol/L), the subjects should contact the investigator for advice. The investigator should instruct the subject to measure his/her pre-breakfast SMPG on 3 consecutive days. If the subject has pre-breakfast SMPG (fasting state) above 240 mg/dL (13.3 mmol/L) on 3 consecutive days, and/or if the investigator judges the subject's condition as unsafe regardless of the pre-breakfast SMPG, the subject will be excluded from the trial at the investigator's discretion, and regarded as screening failure.

Phone contact 1 during wash-out period (P1W) will be performed at 4 weeks (± 7 days) before Visit 2. The phone contact can be replaced with a "visit" if for instance further examination is needed at the investigator's discretion.

Screening failures:

For screening failures the screening failure form in the eCRF must be completed with the reason for not continuing in the trial. Serious adverse events (SAEs) from screening failures must be transcribed by the investigator into the eCRF. Follow-up on SAEs must be carried out according to Section [12](#).

A screening failure session must be made in the IWRS. The case book must be signed.

Re-screening is NOT allowed if the subject has failed one of the inclusion or exclusion criteria, this includes re-sampling if the subject has failed one of the inclusion or exclusion criteria related to laboratory parameters. However, in case laboratory samples are lost (e.g. haemolysed/displaced), re-sampling is allowed.

8.1.2 Fasting visits

The subjects must attend several visits in a fasting state (see Section [2](#)).

Fasting for blood sampling is defined as no food or liquid within the last 8 hours prior to blood sampling, however water is allowed up until 2 hours prior to blood sampling.

For the subjects allocated to oral semaglutide/placebo, trial product must be taken after blood sampling (see Section [5.3.1](#) for dosing instructions). Other oral medication can be taken 30 minutes after trial product. Injectable medications can be administered after blood sampling.

For the subjects allocated to liraglutide, the trial product and/or other oral and injectable medications must be taken after the blood sampling has been performed.

In case a subject attends a fasting visit in a non-fasting state, all non-fasting measurements should be performed. The subject should return to the site in a fasting state to have the fasting blood samples done within the visit window for the relevant visit.

For fasting samples, see Section [8.3.1](#).

8.1.3 Randomisation and trial product administration (visit 2)

Eligible subjects will be randomised into one of 5 treatment arms. The randomisation session must be performed in the IWRS which will allocate the dispensing unit number (DUN) of trial product to be dispensed to the subject.

All visit 2 assessments must be performed before administration of first dose of trial product. Blood samples should be taken after randomisation session since semaglutide antibodies are not applicable for subjects randomised to liraglutide.

Trial products (see Section [9](#)) will be dispensed to the subject by the site, hospital pharmacy or equivalent at each site visit during the trial from randomisation to last visit before the End-of-treatment visit (see Section [2](#)). The investigator must document that subjects are trained in the dosing instructions at every dispensing visit, please see Section [5.3.1](#).

For the subjects randomised to liraglutide, the investigator must instruct the subject to escalate the dose of liraglutide from 0.3 mg once-daily to 0.6 mg once-daily after the first week of treatment and to 0.9 mg once daily after the second week of treatment.

Date of first administration of trial product will be captured in the eCRF.

8.1.4 Phone contacts after randomisation (P3)

The planned phone contact (P3) should be conducted 2 weeks (± 3 days) after randomisation (see Section [2](#)).

For the subjects randomised to liraglutide, at P3, the investigator should follow-up to ensure the dose escalation that should be done by subject.

8.1.5 End-of-treatment (visit 12) and Follow-up (visit 13)

Subjects, who stay on trial product throughout the trial, must attend the End-of-treatment visit (visit 12) 52 weeks after randomisation (± 3 days visit window) and the Follow-up visit (visit 13) 5 weeks after the last date on trial product (+3 days visit window). A completion call must be performed in the IWRS after completion of visit 12 (see Section [10](#)).

In case the subject cannot be reached (by clinic visit or phone contact) at the scheduled visit 13, the site should consult the contacts provided by the subject (e.g. close relatives), relevant physicians and medical records to collect health status. If no health status can be collected, the subject should be considered lost to follow-up and this should be specified in the end-of-trial form.

8.1.6 Premature discontinuation of trial product and follow-up (visits 12A and 13A)

Subjects, who discontinue trial product prematurely, should attend visit 12A scheduled to take place on the day of discontinuation of trial product (+ 3 days visit window). Visit 13A should be scheduled 5 weeks (+3 days visit window) after the last date on trial product. The primary reason for premature discontinuation of trial product must be specified in the end-of-trial form in the eCRF, and final drug accountability must be performed. A treatment discontinuation session must be made in the IWRS at visit 12A (see Section [10](#)).

If premature discontinuation of trial product is decided during a scheduled visit, the visit will be converted into a visit 12A and trial procedures must be performed accordingly.

Subjects should continue with the originally scheduled site contacts after visit 13A and up to and including visit 12. If necessary, in order to retain the subject in the trial, site visits can be replaced by phone contacts after visit 13A. However, as a minimum, these subjects should be asked to attend the scheduled visit 8 at week 26 and end-of-treatment (visit 12) at week 52 as these visits should be performed for all subjects, if at all possible (except subjects who withdraw informed consent, see Section [8.1.7](#)).

Subjects, who only agree to attend or provide health status at the planned visit 12, should not be considered withdrawn from the trial. In case the subject cannot be reached (by clinic visit or phone contact) at the scheduled visit 12, the site should consult the contacts provided by the subject (e.g. close relatives), relevant physicians and medical records to collect health status. If no health status can be collected, the subject should be considered lost to follow-up and this should be specified in the end-of-trial form.

In summary, subjects should stay in the trial irrespective of lack of adherence to randomised treatment, lack of adherence to visit schedule, missing assessments or trial product discontinuation for any reason. Only subjects who decline any further contact with the site in relation to the trial should be considered as withdrawn from the trial (for withdrawal procedures, see Section [8.1.7](#)).

8.1.7 Withdrawals

If a subject considers withdrawing from the trial, the investigator must aim to undertake procedures for visit 12A as soon as possible and visit 13A should be scheduled 5 weeks (+3 days visit window) after the last date on trial product, if the subject agrees to it.

The end-of-trial form must be completed, and final drug accountability must be performed even if the subject is not able to come to the trial site. A treatment discontinuation session must be made in the IWRS. The case book must be signed.

Although a subject is not obliged to give his/her reason(s) for withdrawing consent, the investigator must make a reasonable effort to ascertain the reason(s), while fully respecting the subject's rights. Where the reasons are obtained, the primary reason for withdrawing consent must be specified in the end-of-trial form in the eCRF.

8.1.8 Investigator assessments

Review of diaries, PROs, laboratory reports, ECGs and fundus photography/dilated funduscopy must be documented either on the documents or in the subject's medical record.

If clarification of entries or discrepancies in the diary or PROs is needed, the subject must be questioned and a conclusion made in the subject's medical record. Care must be taken not to bias the subject.

The documents must be retained at the site as source documentation.

For ECGs, physical examinations and eye examinations, the evaluations must follow the categories:

- Normal
- Abnormal
 - Was the result clinically significant? (yes/no)

The evaluation should be based on investigator's judgement.

For laboratory report values outside the reference range, the investigator must specify whether the value is clinically significant or not clinically significant. All laboratory printouts must be signed and dated by the investigator prior to the following visit. The signed laboratory report is retained at the site as source documentation.

In case of abnormal clinically significant findings found as a result of screening procedures conducted at V1 or assessments revealing baseline conditions at V2, the investigator must state a comment in the subject's medical record and record this in the medical history/concomitant illness form in the eCRF.

The Investigator or his/her delegate must collect and review the PROs and diaries for completeness and to ensure that AEs are reported.

8.2 Subject related information/assessments

8.2.1 Demography

Demography will be recorded in the eCRF at screening and consists of:

- Date of birth
- Sex
- Ethnicity
- Race

8.2.2 Diabetes history and diabetes complications

Diabetes history and diabetes complications will be recorded on a disease specific form at screening and consists of:

- Date of diagnosis of T2DM
- Information regarding diabetes complications including date of onset
 - Diabetic retinopathy
 - Diabetic neuropathy
 - Diabetic nephropathy

Please note that macroangiopathy (including peripheral arterial disease) should be reported on the disease specific form History of cardiovascular disease (CVD) (see Section [8.2.3](#)).

8.2.3 Concomitant illness and medical history

A **concomitant illness** is any illness that is present at the start of the trial (V1) or found as a result of a screening procedure or other trial procedures performed before exposure to trial product.

Medical history is a medical event that the subject has experienced in the past. Only relevant medical history as judged by the investigator should be reported.

The information collected for concomitant illness and medical history should include diagnosis, date of onset and date of resolution or continuation, as applicable.

The following must be recorded in the eCRF on the disease specific forms only, i.e. not on the medical history/concomitant illness form:

- **History of CVD** (e.g. ischaemic heart disease, myocardial infarction [MI], heart failure incl. NYHA class, hypertension, stroke, peripheral arterial disease)
- **History of gallbladder disease** (e.g. gallstone, cholecystitis, cholecystectomy)

- **History of gastrointestinal disease** (e.g. gastroesophageal reflux disease, ulcer disease, chronic gastritis)

Any change to a concomitant illness should be recorded during the trial. A clinically significant worsening of a concomitant illness must be reported as an AE (see Section [12](#)).

It must be possible to verify the subject's medical history in source documents such as subject's medical record. If a subject is not from the investigator's own practice; the investigator must make reasonable effort to obtain a copy of subject's medical record from relevant party e.g. primary physician. The investigator must document any attempt to obtain external medical information by noting the date(s) when information was requested and who has been contacted.

8.2.4 Concomitant medication

A **concomitant medication** is any medication, other than the trial product(s), which is taken during the trial, including the screening and follow-up periods.

For subjects previously treated with OAD as monotherapy, this OAD information must be recorded in the concomitant medication form in eCRF.

Details of any concomitant medication must be recorded at the first visit. Changes in concomitant medication must be recorded at each visit as they occur.

The information collected for each concomitant medication includes:

- trade name or generic name
- indication
- start date and stop date or continuation
- only applicable for anti-diabetic medication :start date of current dose and total daily dose

If a change is due to an AE, then this must be reported according to Section [12](#). If the change influences the subject's eligibility to continue in the trial, the monitor must be informed.

8.2.5 Childbearing potential

It must be recorded in the eCRF whether female subjects are of childbearing potential.

Pregnancy testing must be performed on female subjects of childbearing potential as described in Section [8.4.7](#). Female subjects of childbearing potential must be instructed to use adequate contraceptive method throughout the trial and until 5 weeks after end of treatment. Adequate contraceptive measures are abstinence (not having sex), diaphragm, condom (by the partner), intrauterine device, sponge, spermicide or oral contraceptives.

Female of non-childbearing potential is defined as:

- Female who has undergone a hysterectomy, bilateral oophorectomy or bilateral tubal ligation
- Postmenopausal defined as no menses for 12 months without an alternative medical cause
- Other medical reasons preventing childbearing potential

8.2.6 Tobacco use

Details of tobacco use must be recorded at V1. Smoking is defined as smoking at least one cigarette or equivalent daily.

Smoking status:

- Never smoked
- Previous smoker, smoking stop date
- Current smoker

8.3 Efficacy assessments

8.3.1 Laboratory assessments for efficacy

For overall laboratory process see Section [8.5](#).

Blood samples will be drawn according to flow chart (see Section [2](#)) and will be analysed at the central laboratory to determine levels of the following efficacy laboratory parameters (for fasting see Section [8.1.2](#)):

Glucose metabolism:

- HbA_{1c}
- FPG
- Fasting insulin
- Fasting C-peptide
- Fasting glucagon
- Fasting pro-insulin

Fasting lipid profile:

- Total cholesterol
- LDL-cholesterol
- HDL-cholesterol
- VLDL-cholesterol
- Free fatty acids
- Triglycerides

8.3.1.1 Fasting plasma glucose

FPG is measured at the central laboratory in order to evaluate glycaemic control. The subject must attend these visits fasting (see Section [8.1.2](#)).

A central FPG result ≤ 3.9 mmol/L (70 mg/dL) in relation to planned fasting visits should not be reported as a hypoglycaemic episode but as a clinical laboratory adverse event (CLAE) at the discretion of the investigator (see Section [12.1.1](#)).

8.3.2 Self-measured plasma glucose (SMPG)

At visit 1, subjects will be provided with a blood glucose meter (BG meter) including auxiliaries as well as instructions for use. The subjects will be instructed in how to use the device and the instruction will be repeated as necessary during the trial. The provided BG meter should be used for SMPG measurement.

The BG meters use test strips calibrated to plasma values. Therefore, all measurements performed with capillary blood are automatically calibrated to plasma equivalent glucose values, which will be shown on the display.

Only the BG meter provided by Novo Nordisk or the same model purchased by the trial site should be used for the measurements required in the protocol.

Subjects should be instructed in how to record the results of the SMPG values in the diaries. The record of each SMPG value should include date, time and value. All data from the diary must be transcribed into the eCRF during or following the contact. If obtained via phone and a discrepancy is later detected, between the diary and the SMPG data obtained at the phone contact, the values in the eCRF must be corrected.

Occasional review by the investigator of the values stored in the memory of the BG meter and correct reporting of these in the diary is advised in order to ensure adequacy of the data reported in the trial database.

7-point self-measured plasma glucose profile

The subject will be instructed to perform a 7-point SMPG profile 3 times during the trial period (see Section [2](#)) using the BG meter provided for the trial. The 7-point SMPG profile should be performed on a day where the subject does not anticipate unusual strenuous exercise. The 7-point SMPG profile should preferably be taken within a week prior to the visit.

The record of each SMPG measurement should include the following seven time points:

- before breakfast
- 90 minutes after start of breakfast

- before lunch
- 90 minutes after start of lunch
- before dinner
- 90 minutes after start of dinner
- at bedtime

8.3.3 Body weight and height

Body weight must be measured and recorded in the eCRF in kilogram (kg), with one decimal (with an empty bladder, without shoes and only wearing light clothing). The body weight should be assessed on the same calibrated weighing scale equipment throughout the trial, if possible.

Height is measured without shoes in centimetres and recorded in the eCRF to nearest ½ cm.

8.3.4 Waist circumference

The waist circumference is defined as the minimal abdominal circumference located midway between the lower rib margin and the iliac crest.

The measurement of waist circumference must be performed and recorded in the eCRF. Waist circumference is measured in the horizontal plane and rounded up or down to the nearest ½ cm using a non-stretchable measuring tape. The same measuring tape should be used throughout the trial.

The circumference should be measured when the subject is in a standing position, with an empty bladder and wearing light clothing. The subject should be standing, feet together with arms down their side and waist accessible. The tape should touch the skin but not compress soft tissue and twists in the tape should be avoided. The subject should be asked to breathe normally and the measurement should be taken when the subject is breathing out gently.

8.3.5 Patient reported outcomes questionnaires

PRO will be assessed using the questionnaires:

- SF-36v2™ (acute version) health survey^{35,36,37}
- Diabetes Therapy-Related QOL (DTR-QOL) questionnaire³⁸

The questionnaires must be completed by the subject as specified in the flow chart, see Section [2](#), preferably before any other trial-related activities for that visit. It takes approximately 15 minutes to complete the two questionnaires. Subjects should be given the opportunity to complete the questionnaires by themselves without interruption. The completed questionnaires must be reviewed for potential AEs and missing data while the subject is still at the site. All results from the questionnaires must be transferred into the eCRF.

SF-36 acute version

SF-36v2™ is a commonly used instrument to evaluate PROs, also in the T2DM area.

SF-36v2™ acute version measures the individual overall health related quality of life on 8 domains; Physical functioning, Role physical, Bodily pain, General health, Vitality, Social functioning, Role emotional and Mental health. The acute version's questions are based on a recall period of one week. SF-36v2™ contains 36 items.

SF-36v2™ will be translated to Japanese, and also be linguistically validated before being handed out to the subjects participating in the trial.

Diabetes Therapy-Related QOL (DTR-QOL) questionnaire

DTR-QOL is a Japanese questionnaire.

DTR-QOL assesses the influence of diabetes treatment on the individual health related quality of life on 4 domains: “burden on social activities and daily activities”, “anxiety and dissatisfaction with treatment”, “hypoglycemia” and “satisfaction with treatment”. DTR-QOL contains 29 items.

8.4 Safety assessments

8.4.1 Adverse events

Adverse events (AEs) must be reported at each visit in accordance with the procedures outlined in Section [12](#) and appendix B.

8.4.1.1 Medication error

If a medication error is observed during the trial, the following information is required and a specific event form must be completed in the eCRF in addition to the AE form (see Sections [8.4.1.2](#), [12.1.5](#) and appendix B):

- Trial product(s) involved
- Classification of medication error
- Whether the subject experienced any hypoglycaemic episode and/or AE(s) as a result of the medication error
- Suspected primary reason for the medication error

For definition of medication errors, see Section [12.1.4](#) and appendix B.

8.4.1.2 Adverse events requiring additional data collection

For the following AEs additional data collection is required and specific event forms must be completed in the eCRF in addition to the AE form:

- Acute coronary syndrome (MI or unstable angina pectoris requiring hospitalisation)

- Cerebrovascular event (stroke or transient ischaemic attack[TIA])
- Heart failure
- Pancreatitis
- Neoplasm (excluding thyroid neoplasm)
- Thyroid disease (including thyroid neoplasm)
- Renal event
- Hypersensitivity reaction
- Acute gallstone disease
- Medication error
- Lactic acidosis
- Creatine kinase (CK) > 10x UNL
- Hepatic event defined as:
 - ALT or aspartate aminotransferase (AST) > 5x UNL and total bilirubin \leq 2x UNL
 - ALT or AST > 3x UNL and total bilirubin > 2x UNL*
 - Hepatic event leading to trial product discontinuation.

*Please note that in case of a hepatic event defined as ALT or AST >3 x UNL and total bilirubin >2 x UNL, where no alternative aetiology exists (Hy's law), this must be reported as an SAE using the important medical event criterion if no other seriousness criteria are applicable.

See Section [12](#) and appendix B for details about the additional information to report.

Note that additional assessments will be required according to appendix B in case of:

- suspicion of acute pancreatitis
- suspicion of hypersensitivity reaction
- increased levels of CK
- increased levels of aminotransferases

In case any of these events fulfil the criteria for a SAE, please report accordingly, see Section [12](#).

8.4.2 Physical examination

A physical examination will be performed by the investigator according to local procedure (see Sections [2](#) and [8.1.8](#)). A physical examination must include:

- General appearance
- Head, ears, eyes, nose, throat, neck
- Thyroid gland
- Respiratory system
- Cardiovascular system
- Gastrointestinal system including mouth

- Musculoskeletal system
- Central and peripheral nervous system
- Skin
- Lymph node palpation

8.4.3 Vital signs

Systolic and diastolic blood pressure

Systolic and diastolic blood pressure should be measured in a sitting position after the subject has been resting for at least 5 minutes and by using the standard clinical practice at the site. The data must be recorded in the eCRF. The actual value of the blood pressure measurement should be recorded in the eCRF (without rounding). The same equipment should be used throughout the trial.

Pulse

Pulse (beats per minute) must be recorded in the eCRF at site visits after resting for 5 minutes in a sitting position.

8.4.4 Eye examination

Fundus photography or dilated fundoscopy will be performed as per flow chart (see Section [2](#)) by the investigator or according to local practise. Results of the fundus photography or dilated fundoscopy will be interpreted by the investigator (see Section [8.1.8](#)).

If fundus photography or dilated fundoscopy has been performed within 90 days prior to randomisation, the procedure does not need to be repeated at visit 1, unless worsening of visual function since the last examination. The results must be available prior to randomisation.

If the fundus photography or dilated fundoscopy is performed before the subject has signed the informed consent form, it must be documented in the medical records that the reason for performing the procedure was not related to this trial.

8.4.5 Electrocardiogram (12-lead)

12-lead ECG will be performed as per flowchart (see Section [2](#)) and the assessment must be reviewed as described in Section [8.1.8](#) by the investigator. The ECGs will also undergo central assessment and the investigator must forward the ECGs to the central ECG reader as soon as possible.

If the central ECG evaluation of a baseline ECG is suggestive of a prior MI, the investigator will be notified. The investigator should consider if an update of the History of CVD form is required.

If the central ECG evaluation of a post-baseline ECG is suggestive of new MI, the investigator will be notified and a confirmatory ECG should be performed. Unless already done, the investigator should report this as an AE or a SAE at investigator's discretion and according to Section [12](#).

Additional ECG recordings can be performed at the investigator's site at investigator's discretion at other visits than the planned ECG visits. All these ECGs will undergo central assessment. The reason for additional ECG assessments should be documented and an AE should be reported if applicable.

All findings suggestive of new MI detected by the central ECG reading will be adjudicated by the event adjudication committee (EAC) (see Section [12.7.2](#)).

8.4.6 Laboratory assessments for safety

For overall laboratory process see Section [8.5](#).

Blood samples will be drawn according to flow chart (see Section [2](#)) and will be analysed at the central laboratory to determine levels of the following safety laboratory parameters:

Haematology:

- Haemoglobin
- Haematocrit
- Leucocytes
- Thrombocytes
- Differential count (eosinophils, neutrophils, basophils, lymphocytes and monocytes)

Biochemistry:

- ALT
- Albumin
- Alkaline phosphatase (ALP)
- Amylase
- AST
- Bilirubin, total
- Calcium, total
- Creatinine
- eGFR per CKD-EPI³⁹
- CK
- Lipase
- Potassium
- Sodium

- Urea

Hormones:

- Calcitonin

In case any calcitonin value at any time during the trial is ≥ 10 ng/L, the algorithm in appendix A must be followed.

8.4.7 Pregnancy testing

Females of childbearing potential will have a urine dip-stick pregnancy test performed at site as specified in Section 2. For definition of female of non-childbearing potential and contraceptive methods, see Section 8.2.5.

In case a menstrual period is missed or if pregnancy is suspected between the scheduled visits, a urine pregnancy test should be performed. Investigator should instruct the subject to contact the site in case the pregnancy test is positive. Females of childbearing potential will be provided with urine dip-sticks for pregnancy test at home.

8.4.8 Anti-semaglutide antibodies

Samples of anti-semaglutide antibodies are taken only for subjects randomised to oral semaglutide/placebo treatment.

Blood samples will be drawn for measurement of antibodies against semaglutide at selected visits (see Section 2). Positive anti-semaglutide binding antibody samples will be further characterised for cross reactivity to native GLP-1. Samples which are positive for anti-semaglutide binding antibodies will be further characterised for *in vitro* neutralising effect towards semaglutide. In addition, samples which are positive for antibodies cross-reacting with native GLP-1 will be further analysed for *in vitro* neutralising effect towards native GLP-1.

Furthermore, samples drawn at randomisation may be used for calculations of the neutralising effect in the *in vitro* neutralising antibody assays. The *in vitro* neutralising assays will be performed by Novo Nordisk.

At randomisation, the antibody sampling must be done pre-dose.

The special laboratory responsible for anti-semaglutide antibodies will be provided with the randomization list and only samples from subjects treated with oral semaglutide will be analysed for anti-semaglutide antibodies.

Antibody samples will be stored as described in Section 24.2.

8.4.9 Hypoglycaemic episodes

Plasma glucose (PG) should always be measured and recorded when a hypoglycaemic episode is suspected.

All PG values:

- ≤ 3.9 mmol/L (70 mg/dL) or
- > 3.9 mmol/L (70 mg/dL) occurring in conjunction with hypoglycaemic symptoms

should be reported in the diary according to the instructions below throughout the trial from visit 1 to end of trial.

Upon onset of a hypoglycaemic episode the subject is recommended to measure PG every 15 minutes until the SMPG value is >3.9 mmol/L (70 mg/dL) and/or symptoms have been resolved in accordance to current guidelines⁴⁰.

A SMPG value ≤ 3.9 mmol/L (70 mg/dL) or hypoglycaemic symptoms must trigger a hypoglycaemic episode form to be completed by the subject. Repeated SMPG measurements and/or symptoms will per default be considered as one hypoglycaemic episode until a succeeding SMPG value is >3.9 mmol/L (70 mg/dL) and/or symptoms have been resolved. One hypoglycaemic episode form is to cover these measurements and/or symptoms.

In case of several low SMPG values within the hypoglycaemic episode, the lowest value is the one that will be reported as the SMPG value for the hypoglycaemic episode but the start time of the episode will remain as the time for the first SMPG value and/or symptom.

The record should include the following information:

- Start date and time of the hypoglycaemic episode
- Stop date and time of the hypoglycaemic episode (stop time is the first time the PG value is >3.9 mmol/L [70 mg/dL] and/or symptoms have been resolved).
If a stop date and time is not reported, a hypoglycaemic episode will cover a period of 60 minutes.
- The PG level before treating the episode (if available) and any follow-up measurements.
The lowest value measured during the hypoglycaemic episode will be reported as the PG value for the episode, the remaining values will be kept as source data in the diary.
- Whether the episode was symptomatic (Yes/No)
A hypoglycaemic episode starting without symptoms should be updated to symptomatic if the subject experiences symptoms later during the episode.
- Whether the subject was able to treat him/herself
If the severity of a hypoglycaemic episode aggravates, only one hypoglycaemic episode should be reported, reflecting the most severe degree of hypoglycaemia.

- For oral semaglutide and placebo: Date and time of last trial product administration prior to the episode
- For liraglutide or selected anti-diabetes medication: Date, time and dose of last medication administered prior to the episode
- Date and time of last main meal (not including snacks) prior to the episode
- Whether the episode occurred in relation to physical activity
- Change in any concomitant illness
- Any sign of fever and/or other acute disease
- Whether the subject was asleep when the episode occurred
 - If yes, whether the symptoms of the episode woke up the subject

The answer to the question: "Was the subject able to treat him/herself?" must be answered "No" for an episode requiring assistance of another person to actively administer carbohydrate, glucagon, or take other corrective actions. PG concentrations may not be available during an event, but neurological recovery following the return of PG to normal is considered sufficient evidence that the event was induced by a low PG concentration⁴⁰.

Oral carbohydrates must not be given if the subject is unconscious.

If the question "Was the subject able to treat him/herself?" is answered "No", the following information should be recorded by the subject:

- Who assisted in the treatment of the hypoglycaemic episode (i.e. medical person or non-medical person)?
- Where the treatment was administered (in clinic/emergency room/hospital or other. If the subject was treated in clinic/emergency room/hospital, whether they were transported in an ambulance or not)
- Type of treatment provided by another person (i.e. oral carbohydrates, glucagon, IV glucose or other)
- Were symptoms alleviated after administration of treatment?
- Factors contributing to the episode (i.e. physical activity, missed meal, diet change, medication error (i.e. overdose, mix-up between products, incorrect use of device), other factors not listed or unknown)
- Did the subject experience seizure?
- Was the subject unconscious/comatose?
- Did the subject experience any of the following symptoms?⁴¹
 - Autonomic: sweating, trembling, hunger or palpitations (rapid or irregular heart beat)
 - Neuroglycopenic: confusion, drowsiness, speech difficulty, visual disturbances, odd behaviour, impaired balance or incoordination (reduced ability to coordinate movement)
 - General malaise: headache or malaise (feeling discomfort/unease)
- Other symptoms

The investigator must review the diary for low SMPG values not reported as hypoglycaemic episodes (see Section [2](#) for relevant visits). The subject must be questioned whether any of the low values were severe, i.e. whether the subject was able to self-treat or not. If the subject was not able to self-treat, it has to be reported as a severe hypoglycaemic episode on a hypoglycaemic episode form.

Low SMPG values for non-severe hypoglycaemic episodes not having a hypoglycaemic episode form completed within 7 days since the SMPG measurement should be reported on a hypoglycaemic episode form with as much information as possible. Novo Nordisk will not query for additional data except for the start date, SMPG value and whether the subject was able to self-treat due to decreased validity of such data^{42,43}.

The subject must be re-trained in how to report hypoglycaemic episodes if the investigator identifies low SMPG values not reported as hypoglycaemic episodes.

If the hypoglycaemic episode fulfils the criteria for an SAE then an AE form and a safety information form (SIF) must also be filled in, see Section [12](#).

8.5 Laboratory assessments

The laboratory analyses will mainly be performed by a central laboratory. Anti-semaglutide antibodies, *in vitro* neutralising effect to semaglutide and GLP-1, IgE anti-semaglutide antibodies and semaglutide plasma concentration will be analysed by a special laboratory and Novo Nordisk A/S (see Sections [8.4.8](#) and [8.6.1](#)). For some of the analyses related to suspicion of acute pancreatitis and hypersensitivity, a local laboratory must be used (see appendix B).

The handling, transportation and storage of biological samples are described in the laboratory manual (for central and special laboratory details see Attachment I).

Samples will be coded in order to keep subject identity anonymous.

Laboratory samples not drawn on the day of the actual visit should preferably be drawn on another day within the visit window stated in the flow chart (see Section [2](#)). Please note that a laboratory sample pertaining to a specific visit must always be reported to that visit.

For some of the samples drawn during the trial, subjects will be asked to attend the site visits fasting (fasting for blood sampling is defined in Section [8.1.2](#)).

The central laboratory will provide laboratory results to the investigator on an ongoing basis. However, anti-semaglutide antibody and semaglutide plasma concentration results will not be available to the investigator during the trial. These results will be provided to the investigator upon request after the completion of the clinical trial report (CTR).

The laboratory provides results to the trial sites in the units preferred by the trial sites while the results that are transferred to the trial database will always be in SI units.

The laboratory equipment may provide analyses not requested in the protocol but produced automatically in connection with the requested analyses according to specifications in the laboratory standard operating procedures. Such data will not be transferred to the trial database, but abnormal values will be reported to the investigator. The investigator must review all laboratory results for concomitant illnesses and AEs and report these according to Section [8.2.3](#) and Section [12](#).

Laboratory samples will be destroyed at the latest at the completion of the CTR except samples obtained for antibody analysis. Antibody samples will be stored as described in Section [24.2](#).

8.6 Other assessments

8.6.1 Pharmacokinetics

Samples for PK of semaglutide are taken only for subjects randomised to oral semaglutide/placebo treatment.

Blood samples will be drawn for assessment of plasma concentration of semaglutide at selected visits (see Section 2). The semaglutide concentrations will be used for population PK analysis.

Samples for PK analysis will be drawn at any time during the visit except for V8. At V8, samples should be taken pre-dose and 60–90 minutes post dosing.

The date and time of the latest trial product administration prior to the sampling for PK analysis must be recorded and transcribed into the eCRF. The exact date and time for sampling the blood for PK analysis must be recorded on the lab requisition form.

Blood samples for PK analysis must be collected, handled and shipped according to the description in the laboratory manual supplied by the central laboratory (see attachment I).

The special laboratory responsible for PK will be provided with the randomisation list and only samples from subjects treated with oral semaglutide will be analysed for semaglutide plasma concentrations. Semaglutide PK samples will be stored at the special laboratory responsible for PK until final CTR in case Novo Nordisk requests further analysis of the PK samples.

8.6.2 Subject diary

The diaries should be handed out at the visits described in the flow chart Section [2](#). The recordings must be reviewed as described in Section [8.1.8](#) and transcribed to the eCRF at the following visit.

Entries in the diaries are only to be made by the subject, unless otherwise specified.

The investigator should instruct the subject in recording the following data in the diary:

- SMPG taken at pre-breakfast (fasting state) and at any points (if necessary) during wash-out period (for subjects treated with OAD as monotherapy prior to screening only)
- date of first trial product administration
- hypoglycaemic episodes
- changes in concomitant medication
- AEs
- 7-point SMPG profile
- date and time of last trial product administration prior to visits with PK sampling (for subjects randomised to oral semaglutide/placebo treatment only)

8.6.3 Training in the pen-injector for liraglutide

An prefilled pen-injector is used for s.c. administration of liraglutide. The subjects must be trained in how to handle the pen-injector when handed out the first time. Training should be repeated during the trial at regular intervals in order to ensure correct use of the pen-injector. The following should be emphasised:

- Always use a new needle for each injection as this will prevent contamination and blocked needles
- Priming the pen to ensure product flow
- The needle should be kept in the skin while counting slowly to 6 (or as described in the direction for use [DFU]) after the dose counter has returned to zero after injection. If the needle is removed too early then the full dose may not have been delivered. Always remove the needle after each injection and store the pen-injector with no needle attached.

The investigator must document that direction for use is given to the subject verbally and in writing at the first dispensing visit (visit 2) (see Section [9.2](#)) and at subsequent visits when judged necessary by the investigator.

8.7 Subject compliance

Throughout the trial, the investigator will remind the subjects to follow the trial procedures and requirements to ensure subject compliance.

Treatment compliance: Will be assessed by monitoring of drug accountability. Prior to visits where drug accountability is performed, the subject will be asked to return all used, partly used and unused trial products. The investigator must assess the amount of trial products returned compared to what was dispensed at the last dispensing visit and, in case of discrepancies, question the subject.

If a subject is found to be non-compliant, the investigator will remind the subject of the importance of following the instructions given including taking the trial products as prescribed and should document this discussion in the subject's medical record.

9 Trial supplies

Trial supplies comprise trial products and auxiliary supplies. Additional details regarding trial supplies can be found in the Trial Materials Manual (TMM).

Trial products must not be dispensed to any person not included in the trial.

Liraglutide must only be used, if it appears clear and colourless or almost colourless.

9.1 Trial products

The following trial products are considered as investigational medicinal products (IMPs) and will be provided by Novo Nordisk A/S, Denmark:

Table 9–1 Investigational medicinal products

Trial product	Strength	Dosage form	Route of administration	Container/delivery device
Semaglutide 3 mg tablet	3 mg	Tablet	Oral	Dosepack ^a
Semaglutide 7 mg tablet	7 mg			
Semaglutide 14 mg tablet	14 mg			
Placebo tablet	N/A			
Liraglutide	6 mg/mL	Solution for injection	s.c.	Pen-injector

^a One dosepack contains one blister card with 7 tablets

Rescue medication is considered NIMPs and will not be supplied by Novo Nordisk. However, during the treatment period, all anti-diabetic medication including rescue medication will be reimbursed by Novo Nordisk Japan according to the local requirement.

For semaglutide tablets the active drug and the corresponding placebo are identical with regard to visual appearance. Furthermore, all semaglutide tablets are visually identical to each other, irrespective of the dose levels

9.2 Labelling

The trial products will be labelled in accordance with Annex 13⁴⁴, local regulations and trial requirements.

Each trial site will be supplied with sufficient trial products for the trial on an on-going basis controlled by the IWRS. Trial product will be distributed to the trial sites according to enrolment and randomisation.

The investigator must document that direction for use is given to the subject verbally and in writing at the first dispensing visit (visit 2). Direction for use should be given to the subject at subsequent visits when judged necessary by the investigator.

The subjects allocated to liraglutide must be trained in how to handle the pen-injector when handed out the first time. Training should be repeated during the trial at regular intervals in order to ensure correct use of the pen-injector.

9.3 Storage

Storage conditions of the trial products are outlined in [Table 9–2](#).

Table 9–2 Storage conditions

Trial product	Storage conditions (not-in-use)	In-use conditions	In-use time
Semaglutide 3 mg tablet	Do not store above 30°C	Take the tablet immediately after dispensation from blister card Take the tablets whole: Do not break or chew	N/A
Semaglutide 7 mg tablet	Do not freeze		
Semaglutide 14 mg tablet	Do not refrigerate		
Placebo tablet	Store in the original package		
Liraglutide 6 mg/mL	Store in a refrigerator 2°C to 8°C Protect from light Do not freeze	At temperatures below 30°C or in a refrigerator 2°C to 8°C Protect from light Do not freeze	Use within one month ^a

^a In-use time starts when first dose is taken out of the refrigerator at subjects' home.

The head of the study site and/or the trial product storage manager (if assigned by the head of the study site) must ensure that trial product is kept under proper storage conditions and record and evaluate the temperature. The head of the study site and/or the trial product storage manager must inform Novo Nordisk **immediately** if any trial product has been stored outside specified conditions (e.g. outside temperature range). Additional details regarding handling of temperature deviations can be found in the TMM.

Trial product that has been stored improperly must not be dispensed to any subject before it has been evaluated and approved for further use by Novo Nordisk. The head of the study site and/or the trial product storage manager must take appropriate action to ensure correct storage.

9.4 Drug accountability and destruction

Drug accountability of all trial products received at site is the responsibility of the head of the study site and/or the trial product storage manager.

Subjects must be instructed to return all used, partly used and unused trial products including empty packaging material at each dispensing visit.

Returned trial product (used/partly used and/or unused), expired or damaged trial product can be stored at room temperature and must be stored separately from non-allocated trial product.

Non-allocated trial products including expired or damaged products must be accounted as unused at the latest at closure of the trial site.

Drug accountability is performed by using the IWRS. Drug accountability must be done on tablet level for semaglutide and placebo and pen level for liraglutide.

Destruction of trial products can be performed on an on-going basis and will be done according to local procedures after accountability is finalised and reconciled by the monitor. Destruction of products must be documented in the IWRS.

9.5 Auxiliary supplies

The following will be provided by Novo Nordisk in accordance with the TMM.

- DFU for liraglutide pen-injector

The following will also be provided by Novo Nordisk Pharma Ltd. The trial sites are allowed to purchase and supply themselves with auxiliary supplies except for needles, if possible. BG meters and test strips must be the same model as supplied by Novo Nordisk.

- Needles for pen-injector
- BG meter and BG meter auxiliaries

Only needles provided by Novo Nordisk must be used for administration of liraglutide.

10 Interactive web response system

A trial-specific IWRS will be set up which can be accessed at any time via the internet or telephone. Access to the IWRS must be restricted to and controlled by authorised persons.

IWRS is used for:

- Screening
- Screening failure
- Randomisation
- Medication arrival
- Dispensing
- Treatment discontinuation
- Completion
- Code break
- Drug accountability
- Data change

IWRS user manuals will be provided to each trial site. DUNs will be allocated using the IWRS. It is important to dispense the exact allocated DUNs to a subject.

11 Randomisation procedure and breaking of blinded codes

The trial is a double-blind trial with regard to three dose levels of oral semaglutide (3, 7 and 14 mg) and placebo, and open-label trial (between oral semaglutide/placebo arms and a liraglutide arm). A randomisation session will be carried out for all subjects using the IWRS.

At the randomisation visit (visit 2), subjects meeting all eligibility criteria will be randomised to one of five parallel treatment arms as described in Section [5.1](#).

Randomisation will be stratified based on pre-trial treatment (with or without OAD) at screening to ensure an even distribution of the 5 treatment arms within strata.

11.1 Breaking of blinded codes

Since the trial is double-blinded with regard to semaglutide and placebo, the blinded codes may possibly be broken for the subjects allocated to semaglutide/placebo treatment arms. The IWRS will notify Novo Nordisk (monitor and the Global Safety department) immediately after the code is broken.

The code for a particular subject allocated to oral semaglutide/placebo may be broken in a medical emergency if knowing the actual treatment would influence the treatment of the subject. Whenever a code is broken the person breaking the code must print the Code Break Confirmation Notification generated by the IWRS, record the reason, and sign and date the document.

When the code is broken, the treatment allocation will be accessible to the investigator and the Novo Nordisk Global Safety department. If IWRS is not accessible at the time of code break the IWRS helpdesk should be contacted. Contact details are listed in Attachment I. If the code has been broken, the subject must discontinue treatment with trial product but be asked to continue in the trial (see Section [8.1.6](#)). A treatment discontinuation session must be completed in IWRS.

12 Adverse events, and technical complaints and pregnancies

12.1 Definitions

12.1.1 Adverse event

An adverse event (AE) is any untoward medical occurrence in a subject administered a medicinal product, and which does not necessarily have a causal relationship with this treatment.

An AE can therefore be any unfavourable and unintended sign (including an abnormal laboratory finding), symptom or disease temporally associated with the use of a product, whether or not considered related to the product.

An AE includes:

- A clinically significant worsening of a concomitant illness.
- A clinical laboratory adverse event (CLAE): a clinical laboratory abnormality which is clinically significant, i.e. an abnormality that suggests a disease and/or organ toxicity and is of a severity that requires active management. Active management includes active treatment or further investigations, for example change of medicine dose or more frequent follow-up due to the abnormality.

The following should **not** be reported as AEs:

- Pre-existing conditions, including those found as a result of screening or other trial procedures performed before exposure to trial product (pre-existing conditions should be reported as medical history or concomitant illness).
- Pre-planned procedures unless the condition for which the procedure was planned has worsened from the first trial related activity after the subject has signed the informed consent.
- Non-serious hypoglycaemia is an AE, but is reported on a hypoglycaemic episode form instead of on an AE form, see Section [8.4.9](#).

The following three definitions are used when assessing an AE:

- **Severity**
 - **Mild** – no or transient symptoms, no interference with the subject's daily activities.
 - **Moderate** – marked symptoms, moderate interference with the subject's daily activities.
 - **Severe** – considerable interference with the subject's daily activities; unacceptable.
- **Causality**

Relationship between an AE and the relevant trial product(s):

 - **Probable** – Good reason and sufficient documentation to assume a causal relationship.
 - **Possible** – A causal relationship is conceivable and cannot be dismissed.
 - **Unlikely** – The event is most likely related to aetiology other than the trial product.

- **Final outcome**

- **Recovered/resolved** – The subject has fully recovered, or by medical or surgical treatment the condition has returned to the level observed at the first trial-related activity after the subject signed the informed consent.
- **Recovering/resolving** – The condition is improving and the subject is expected to recover from the event. This term is only applicable if the subject has completed the trial or has died from another AE.
- **Recovered/resolved with sequelae** – The subject has recovered from the condition, but with lasting effect due to a disease, injury, treatment or procedure. If a sequela meets an SAE criterion, the AE must be reported as an SAE.
- **Not recovered/not resolved** – The condition of the subject has not improved and the symptoms are unchanged, or the outcome is not known.
- **Fatal** – This term is only applicable if the subject died from a condition related to the reported AE. Outcomes of other reported AEs in a subject before he/she died should be assessed as “recovered/resolved”, “recovering/resolving”, “recovered/resolved with sequelae” or “not recovered/not resolved”. An AE with fatal outcome must be reported as an SAE.
- **Unknown** – This term is only applicable if the subject is lost to follow-up.

12.1.2 Serious adverse event

A serious adverse event (SAE) is an experience that at any dose results in any of the following:

- Death.
- A life-threatening^a experience.
- In-patient hospitalisation^b or prolongation of existing hospitalisation.
- A persistent or significant disability or incapacity^c.
- A congenital anomaly or birth defect.
- Important medical events that may not result in death, be life threatening^a or require hospitalisation^b may be considered an SAE when - based on appropriate medical judgement - they may jeopardise the subject and may require medical or surgical intervention to prevent one of the outcomes listed in the definition of SAE^d.

^a The term “life threatening” in the definition of SAE refers to an event in which the subject was at risk of death at the time of the event. It does not refer to an event which hypothetically might have caused death if it was more severe.

^b The term “hospitalisation” is used when a subject:

- Is admitted to a hospital or in-patient, irrespective of the duration of physical stay, or
- Stays at the hospital for treatment or observation for more than 24 hours

Medical judgement must always be exercised, and when in doubt, the hospital contact should be regarded as a hospitalisation. Hospitalisations for administrative, trial related and social purposes do not constitute AEs and should therefore not be reported as AEs or SAEs. Hospital admissions for surgical procedures, planned before trial inclusion, are not considered AEs or SAEs.

^c A substantial disruption of a subject's ability to conduct normal life functions (e.g. following the event or clinical investigation the subject has significant, persistent or permanent change, impairment, damage or disruption in his/her body function or structure, physical activity and/or quality of life).

^d For example intensive treatment in an emergency room or at home of allergic bronchospasm, blood dyscrasia or convulsions that do not result in hospitalisation, or development of drug dependency or drug abuse.

The following AEs must always be reported as an SAE using the important medical event criterion if no other seriousness criteria are applicable:

- suspicion of transmission of infectious agents via the trial product
- risk of liver injury defined as ALT or AST >3 x UNL and total bilirubin >2 x UNL, where no alternative aetiology exists (Hy's law).

Additional assessments should be made for events meeting the criterion of Hy's law as stated above (see appendix B).

12.1.3 Non-serious adverse event

A non-serious AE is any AE which does not fulfil the definition of an SAE.

12.1.4 Medication errors

A medication error concerning trial products is defined as:

- Administration of wrong drug or use of wrong device.
Note: Use of wrong DUN is not considered a medication error unless it results in administration of wrong drug.
- Wrong route of administration, such as intramuscular instead of s.c..
- Administration of an overdose with the intention to cause harm (e.g. suicide attempt), misuse or abuse of trial product.
- Accidental administration of a higher dose than intended. A higher dose is a dose of at least one tablet more than the intended dose and for pen injection a higher dose than 0.9 mg/day; however, the administered dose must deviate from the intended dose to an extent where clinical consequences for the trial subject were likely to happen as judged by the investigator, although they did not necessarily occur.

Medication errors must be reported on an AE form and a specific event form, see Sections [8.4.1.1](#), [12.1.5](#) and appendix B.

12.1.5 Adverse events requiring additional data collection

AEs requiring additional data collection are AEs where the additional data will benefit the evaluation of the product safety. A number of AEs that always require additional data collection have been pre-specified. See appendix B for details about these events and the additional information to report.

Some events in this trial will be adjudicated by an independent external committee as described in Section [12.7.2](#).

[Table 12-1](#) lists AEs that require completion of specific event forms in the eCRFs and/or are subject to event adjudication.

Table 12–1 Adverse events requiring completion of specific event forms and/or are subject to event adjudication

Event	Specific event form	Event adjudication
Death	No	Yes
Acute coronary syndrome (MI or unstable angina pectoris requiring hospitalisation)	Yes	Yes
Cerebrovascular event (stroke or TIA)	Yes	Yes
Heart failure	Yes	Yes (only if requiring hospitalisation)
Pancreatitis	Yes	Yes (only if acute pancreatitis)
Neoplasm (excluding thyroid neoplasm)	Yes	Yes (only if malignant)
Thyroid disease (including thyroid neoplasm)	Yes	Yes (only if malignant thyroid neoplasm or C-cell hyperplasia)
Renal event	Yes	Yes (only if acute kidney injury)
Hypersensitivity reaction	Yes	No
Acute gallstone disease	Yes	No
Medication error	Yes	No
Lactic acidosis	Yes	Yes
CK > 10x UNL	Yes	No
Hepatic event defined as: ALT or AST > 5x UNL and total bilirubin ≤ 2x UNL ALT or AST > 3x UNL and total bilirubin > 2x UNL* Hepatic event leading to trial product discontinuation.	Yes	No

* Please note that in case of a hepatic event defined as ALT or AST > 3 x UNL and total bilirubin > 2 x UNL, where no alternative aetiology exists (Hy's law), this must be reported as an SAE using the important medical event criterion if no other seriousness criteria are applicable.

For details about specific event forms, see Sections [8.4.1.2](#), [12.2](#) and appendix B.

12.1.6 Technical complaints

A technical complaint is any written, electronic, or oral communication that alleges product (medicine or device) defects. The technical complaint may be associated with an AE, but does not concern the AE itself.

Examples of technical complaints:

- The physical or chemical appearance of trial products (e.g. discoloration, particles or contamination)
- All packaging material including labelling
- Problems related to devices (e.g. to the injection mechanism, dose setting mechanism, push button or interface between the pen and the needle)

12.2 Reporting of adverse events

All events meeting the definition of an AE must be collected and reported. This includes events occurring from the first trial-related activity after the subject has signed the informed consent until the end of the post-treatment follow-up period (V13) for subjects on trial product OR until the end of trial (V12 or V13A, whichever comes last) for the subjects who have discontinued trial product prematurely. Events for withdrawn subjects will be collected and reported until last trial related contact with the subject. The events must be recorded in the applicable eCRF forms in a timely manner, see timelines below and [Figure 12-1](#).

During each contact with the trial site staff, the subject must be asked about AEs and technical complaints, for example by asking: “Have you experienced any problems since the last contact?”

All AEs, either observed by the investigator or subject, must be reported by the investigator and evaluated.

All AEs must be recorded by the investigator in the eCRF AE form. The investigator should report the diagnosis, if available. If no diagnosis is available, the investigator should record each sign and symptom as individual AEs using separate AE forms in the eCRF.

For SAEs, a SIF must be completed in addition to the AE form. A SIF is a form to collect supplementary clinical information. If several symptoms or diagnoses occur as part of the same clinical picture, one SIF can be used to describe all the SAEs.

AEs requiring additional data collection must be reported using both the AE form and the specific event form. A specific event form is a form tailored to collect specific information related to the individual event. See appendix B for details about the events and the additional information to report. In case any of these events fulfil the criteria for seriousness in Section [12.1.2](#), then the event should be reported as serious.

Some events will undergo event adjudication by the EAC, please refer to Section [12.7.2](#). For AEs qualifying for event adjudication, the adjudication form will also have to be completed in the eCRF. The adjudication form is a checklist of clinical data to be provided from the site.

For an overview of AEs requiring additional data collection and AEs that will undergo event adjudication, please see [Table 12-1](#).

For all non-serious AEs, the applicable forms should be signed when the event is resolved or at the end of the trial at the latest.

Timelines for initial reporting of AEs:

The investigator must complete the following forms in the eCRF within the specified timelines:

- **SAEs:** The AE form **within 24 hours** and the SIF **within 5 calendar** days of the investigator's first knowledge of the SAE.

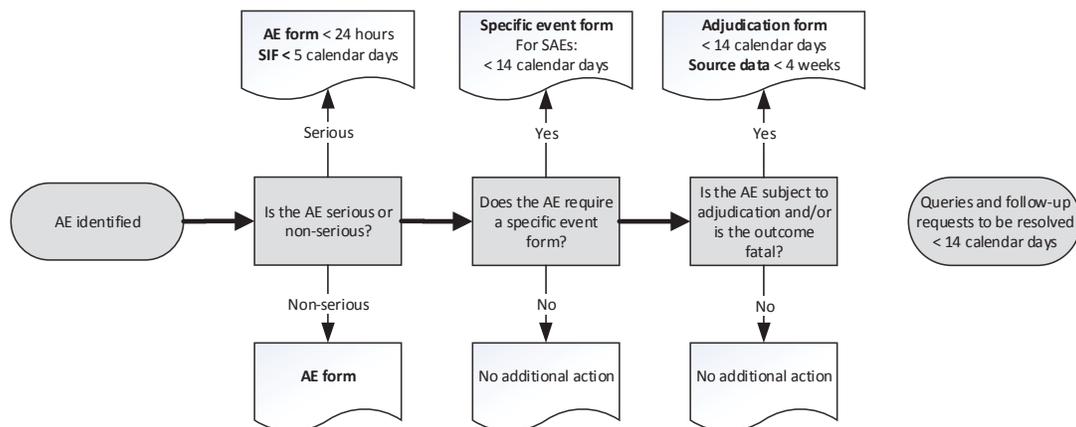

Both forms must be signed within 7 calendar days from the date the information was entered in the eCRF.

For SAEs requiring reporting on a specific event form: In addition to the above the specific event form within **14 calendar days** from the investigator's first knowledge of the AE.

- **Events for adjudication:** The adjudication form should be completed **within 14 calendar days** of the investigator's first knowledge of the AE, see Section [12.7.2](#). The investigator should preferably provide the medical documentation within **4 weeks** of event identification according to instructions in the event adjudication site manual.

If the eCRF is unavailable, the concerned AE information must be reported on a paper AE form and sent to Novo Nordisk by fax, e-mail or courier within the same timelines as stated above. When the eCRF becomes available again, the investigator must enter the information on the form into the eCRF.

Contact details (fax, telephone, e-mail and address) are provided in the investigator trial master file.

Timelines are for the completion of forms from the time of investigator's awareness.
AE: Adverse event SAE: Serious adverse event SIF: Safety Information form

Figure 12–1 Reporting of AEs

Novo Nordisk assessment of AE expectedness:

Novo Nordisk assessment of expectedness is performed according to the following reference documents:

- IB for oral semaglutide (NN9924)²⁵; Current version and any updates thereto.
- Company Core Data Sheet (CCDS) for liraglutide; current version and any updates thereto.

Reporting of trial product-related SUSARs by Novo Nordisk:

Novo Nordisk will notify the investigator of trial product-related suspected unexpected serious adverse reactions (SUSARs) in accordance with local requirements and ICH GCP¹. In addition, the investigator will be informed of any trial-related SAEs that may warrant a change in any trial procedure.

In accordance with regulatory requirements, Novo Nordisk will inform the regulatory authorities, including European Medicines Agency (EMA), of trial product-related SUSARs. In addition, Novo Nordisk will inform the institutional review boards (IRBs) of trial product-related SUSARs in accordance with local requirement and ICH GCP¹, unless locally this is an obligation of the investigator.

Novo Nordisk products used as concomitant medication or non-investigational medicinal product:

If an AE is considered to have a causal relationship with a Novo Nordisk marketed product used as NIMP product or concomitant medication in the trial, it is important that the suspected relationship is reported to Novo Nordisk, e.g. in the alternative aetiology section on the SIF. Novo Nordisk may need to report this AE to relevant regulatory authorities.

12.3 Follow-up of adverse events

The investigator must record follow-up information by updating the medical records and the forms in the eCRF.

Follow-up information must be reported to Novo Nordisk according to the following:

- **SAEs:** All SAEs must be followed until the outcome of the event is “recovered/resolved”, “recovered/resolved with sequelae” or “fatal”, and until all queries have been resolved. Cases of chronic conditions, cancer or AEs ongoing at time of death (where death is due to another AE) may be closed with the outcome “recovering/resolving” or “not recovered/not resolved”. Cases can be closed with the outcome of “recovering/resolving” when the subject has completed the follow-up period and is expected by the investigator to recover.

The SAE follow-up information should only include new (e.g. corrections or additional) information and must be reported **within 24 hours** of the investigator’s first knowledge of the

information. This is also the case for previously non-serious AEs which subsequently become SAEs.

- **Non-serious AEs:** Non-serious AEs must be followed until the outcome of the event is “recovering/resolving”, “recovered/resolved” or “recovered/resolved with sequelae” or until the end of the follow-up period stated in the protocol, whichever comes first, and until all queries related to these AEs have been resolved. Cases of chronic conditions, cancer or AEs ongoing at time of death (where death is due to another AE) may be closed with the outcome “recovering/resolving” or “not recovered/not resolved”. Cases can be closed with the outcome of “recovering/resolving” when the subject has completed the follow-up period and is expected by the investigator to recover.
- **Events for adjudication:** if new information becomes available for events in scope of adjudication, this must be uploaded to the adjudication database in order for the EAC to evaluate if re-adjudication is needed.

The investigator must ensure that the recording of the worst case severity and seriousness of an event is kept throughout the trial. A worsening of an unresolved AE must be reported as follow-up with re-assessment of severity and/or seriousness of the event.

Queries or follow-up requests from Novo Nordisk must be responded to **within 14 calendar days** from the date of receipt of the request, unless otherwise specified in the follow-up request.

SAEs after end of trial: If the investigator becomes aware of an SAE with a suspected causal relationship to the IMP occurring to a subject after the subject has ended the trial, the investigator should report this SAE within the same timelines as for SAEs during the trial.

12.4 Technical complaints and technical complaint samples

12.4.1 Reporting of technical complaints

All technical complaints on any of the following products:

- semaglutide 3 mg/7 mg/14 mg or placebo tablets
- liraglutide 6 mg/mL, 3 mL pre-filled pen-injector
- needles for pen-injector

which occur from the time of first usage of the product until the time of the last usage of the product, must be collected and reported to Customer Complaint Center, Novo Nordisk.

Contact details (fax, e-mail and address) are provided in Attachment I to the protocol.

The investigator must assess whether the technical complaint is related to any AEs and/or SAEs.

Technical complaints must be reported on a separate technical complaint form:

- One technical complaint form must be completed for each affected DUN
- If DUN is not available, a technical complaint form for each batch, code or lot number must be completed

The investigator must complete the technical complaint form in the eCRF within the following timelines of the trial site obtaining knowledge of the technical complaint:

- Technical complaint assessed as related to an SAE **within 24 hours**
- All other technical complaints **within 5 calendar days**

If the eCRF is unavailable or when reporting a technical complaint that is not subject related, the information must be provided on a paper form by fax, e-mail or courier to Customer Complaint Center, Novo Nordisk, within the same timelines as stated above. When the eCRF becomes available again, the investigator must enter the information on the technical complaint form in the eCRF.

12.4.2 Collection, storage and shipment of technical complaint samples

The investigator must collect the technical complaint sample and notify the monitor **within 5 calendar days** of obtaining the sample at trial site. The monitor must coordinate the shipment to Customer Complaint Center, Novo Nordisk (the address is provided in Attachment I) and ensure that the sample is sent as soon as possible. A copy of the technical complaint form must be included in the shipment of the sample. If several samples are returned in one shipment, the individual sample and the corresponding technical complaint form must be clearly separated.

The investigator must ensure that the technical complaint sample contains the batch, code or lot number and, if available, the DUN. All parts of the DUN should be returned.

If the technical complaint sample is unobtainable, the investigator must specify on the technical complaint form why it is unobtainable.

Storage of the technical complaint sample must be done in accordance with the conditions prescribed for the product.

12.5 Pregnancies

12.5.1 Pregnancies in female subjects

Female subjects must be instructed to notify the investigator immediately if they become pregnant during the trial. The investigator must report any pregnancy in subjects who have received trial product(s).

The investigator must follow the pregnancy until the pregnancy outcome and the newborn infant is one month of age.

The investigator must report information about the pregnancy, pregnancy outcome, and health of the newborn infant(s), as well as AEs in connection with the pregnancy, and AEs in the foetus and newborn infant.

The following must be collected and reported by the investigator to Novo Nordisk - electronically (e.g. in PDF format), or by fax or courier:

1. **Reporting of pregnancy information**

Information about the pregnancy and pregnancy outcome/health of the newborn infant(s) has to be reported on Maternal Form 1A and 1B, respectively.

When the pregnancy outcome is abnormal (i.e. congenital anomalies, foetal death including spontaneous abortion and/or any anomalies of the foetus observed at gross examination or during autopsy), and/or when a congenital anomaly is diagnosed within the first month, further information has to be reported for the female subject on Maternal Form 2. In addition, information from the male partner has to be reported on the Paternal Form, after an informed consent has been obtained from the male partner.

Initial reporting and follow-up information must be reported **within 14 calendar days** of the investigator's first knowledge of initial or follow-up information.

2. **Reporting of AE information**

The investigator has to report AEs in connection with the pregnancy as well as in the foetus and newborn infant(s). The SAEs that must be reported include abnormal outcome, such as foetal death (including spontaneous abortion), and congenital anomalies (including those observed at gross examination or during autopsy of the foetus), as well as other pregnancy complications fulfilling the criteria of an SAE.

Forms and timelines for reporting AEs:

Non-serious AEs:

- AE form^a **within 14 calendar days** of the investigator's first knowledge of the initial or follow-up information to the non-serious AE.

SAEs:

- AE form^a **within 24 hours** of the investigator's first knowledge of the SAE.
- SIF **within 5 calendar days** of the investigator's first knowledge of the SAE.
- **SAE follow-up information** to the AE form and/or SIF **within 24 hours** of the investigator's first knowledge of the follow-up information.

^a It must be clearly stated in the AE diagnosis field on the AE form if the event occurred in the subject, foetus or newborn infant. If the AE occurred in the foetus or newborn infant, the AE can only be reported on paper AE form and SIF.

Any queries or follow-up requests from Novo Nordisk to non-serious AEs, SAEs and pregnancy forms must be responded to by the investigator **within 14 calendar days** from the date of receipt of the request, unless otherwise specified in the follow-up request.

12.6 Precautions and/or overdose with oral semaglutide

There are no specific antidotes to semaglutide. Treatment of an overdose should be symptomatic.

There is a potential risk of hypoglycaemia during dosing with semaglutide. The typical signs and symptoms of a non-severe hypoglycaemia include: hunger, slight headache, nausea, light-headedness, palpitations and sweating. Symptoms of non-severe hypoglycaemia should be treated by ingestion of carbohydrates.

Severe hypoglycaemia resulting in loss of consciousness should be treated according to best available medical practise.

One case of accidental overdose of oral semaglutide was reported in the NN9924-3692 trial. The subject accidentally took the trial product [REDACTED] day and was thus treated with 20 mg of oral semaglutide. The subject did not report any symptoms and treatment was continued without any change.

One case of accidental overdose has been reported in subjects treated with s.c. semaglutide once weekly. The subject inadvertently injected [REDACTED] mg of semaglutide instead of 0.4 mg, which corresponds to a [REDACTED]-fold higher dose than the maximum dose included in that trial. After [REDACTED] hours the subject felt nauseated, vomited and had a headache. The subject was instructed to drink sufficient amounts of fluids. [REDACTED] and the subject wished to continue in the trial. No symptoms of hypoglycaemia or any other symptoms or signs were noted.

For further details please see the current edition of the IB for oral administration of semaglutide (NN9924), edition 7, and any updates hereof.

For liraglutide and placebo, see Sections [18.1.2](#) and [18.1.3](#), respectively.

12.7 Committees related to safety

12.7.1 Novo Nordisk safety committee

Novo Nordisk will constitute an internal oral semaglutide safety committee to perform ongoing safety surveillance. The oral semaglutide safety committee may recommend unblinding of any data for further analysis, and in this case an independent ad hoc group will be established in order to maintain the blinding of the trial personnel.

12.7.2 Event adjudication committee

An independent external EAC is established to perform validation of selected AEs according to pre-defined diagnostic criteria. The validation is based on review of pre-defined clinical data related to the specific AE. Pre-defined clinical data consist of copies of source documents collected and delivered by the investigational sites.

The EAC is composed of permanent members covering required medical specialities. EAC members must disclose any potential conflicts of interest and must be independent of Novo Nordisk.

The events are reviewed by the EAC in a blinded manner. The EAC will have no authorisations to impact on trial conduct, trial protocol or amendments.

The EAC works in accordance with written guidelines included in the EAC Charter describing in details the composition, tasks, responsibilities and work processes of the committee.

The events outlined in [Table 12–2](#) have been selected for adjudication in order to obtain an external independent validation of the diagnosis. In addition, cardiovascular events are being adjudicated according to U.S. Food and Drug Administration (FDA) requirements⁴⁵.

The EAC will review copies in English (translated if necessary) of medical documentation received in the adjudication packages (e.g. x-rays, ECGs, ultrasound images, discharge summaries, pathology reports and death certificates). The investigator must provide medical documentation as soon as possible, when they receive the request from Novo Nordisk or the event adjudication vendor.

The AEs for adjudication are listed in [Table 12–2](#).

Table 12–2 Adverse events for adjudication

Events	Description	Adjudication outcome
Death*	<ul style="list-style-type: none"> All-cause death 	<ul style="list-style-type: none"> Cardiovascular death (including undetermined cause of death) Non-cardiovascular death
Acute Coronary Syndrome	<ul style="list-style-type: none"> Acute Coronary Syndrome conditions include: ST-elevation acute myocardial infarction (STEMI) Non-ST elevation acute myocardial infarction (NSTEMI) Silent MI Unstable angina pectoris requiring hospitalisation 	<ul style="list-style-type: none"> Acute MI (STEMI or NSTEMI), silent MI Unstable angina pectoris requiring hospitalisation
Cerebrovascular event	<ul style="list-style-type: none"> Episode of focal or global neurological dysfunction caused by brain, spinal cord, or retinal vascular injury as a result of haemorrhage or infarction TIA is defined as a transient episode (< 24 hours) of focal neurological dysfunction caused by brain, spinal cord, or retinal ischaemia, without acute infarction 	<ul style="list-style-type: none"> Ischaemic stroke Haemorrhagic stroke Undetermined stroke TIA
Heart failure requiring hospitalisation	Hospitalisation with a primary diagnosis of heart failure (new episode or worsening of existing heart failure)	<ul style="list-style-type: none"> Heart failure requiring hospitalisation
Acute pancreatitis	<p>The diagnosis of acute pancreatitis requires two of the following three features:</p> <ul style="list-style-type: none"> Abdominal pain consistent with acute pancreatitis (acute onset of a persistent, severe, epigastric pain often radiating to the back) Serum lipase activity (and/or amylase activity) at least three times greater than the UNL Characteristic findings of acute pancreatitis on imaging 	<p>Acute pancreatitis</p> <ul style="list-style-type: none"> Mild Moderately severe Severe
Malignant neoplasm	<p>Malignant neoplasms are defined as</p> <ul style="list-style-type: none"> neoplasms in which abnormal cells divide without control and can invade nearby tissues and/or spread to other parts of the body through the blood and lymph systems <p>Thyroid neoplasms are excluded in this event category</p>	<ul style="list-style-type: none"> Malignant neoplasm

Thyroid disease, if malignant thyroid neoplasm or C-cell hyperplasia	<p>Malignant thyroid neoplasms are defined as</p> <ul style="list-style-type: none"> thyroid neoplasms in which abnormal cells divide without control and can invade nearby tissues and/or spread to other parts of the body through the blood and lymph systems C-cell hyperplasia, defined as hyperplasia of the parafollicular C-cells of the thyroid gland 	<ul style="list-style-type: none"> Malignant thyroid neoplasm C-cell hyperplasia
Acute kidney injury	<p>Acute kidney injury⁴⁶ is defined as any of the following (not graded):</p> <ul style="list-style-type: none"> Increase in serum creatinine by ≥ 0.3 mg/dL (≥ 26.5 μmol/L) within 48 hours, or Increase in serum creatinine to ≥ 1.5 times baseline, which is known or presumed to have occurred within the prior 7 days, or Urine volume < 0.5 mL/kg/h for 6 hours 	<ul style="list-style-type: none"> Acute kidney injury
Lactic acidosis	<ul style="list-style-type: none"> Lactic acidosis is characterized by increased blood lactate level in association with metabolic acidosis 	<ul style="list-style-type: none"> Lactic acidosis

*Death is not a separate event, but an outcome

There are different processes for capturing events for adjudication:

- Direct reporting by investigator:
 - All AEs need to be assessed by the investigator if any AE category is applicable. If the AE category selected is in scope for adjudication, the event specific adjudication form in the eCRF will be populated for sites to complete
 - AEs with fatal outcome
- Screening:
 - All AEs will be screened by NN for potential missed events for adjudication and if needed, the investigator will be asked to provide additional information such as an alternative aetiology, underlying cause(s) and/or clinical details.
 - All ECGs will be centrally read. If the central reading conclusion is suggestive of new MI, the ECG adjudication form will be populated for sites to complete for all post-baseline ECGs.
- EAC identified events:
 - The EAC can decide to have an AE adjudicated even if not initially reported as an event for adjudication by the investigator.

Event adjudication will be performed for AEs in randomised subjects including AEs with an onset date during the screening period. Event adjudication will not be performed for AEs in screening failures.

AEs for adjudication must be reported according to Section [12.2](#). In addition the specific adjudication form should be completed within 14 calendar days of the investigator's first

knowledge of the AE, and all relevant predefined documents provided within 4 weeks according to instructions in the event adjudication site manual.

The assessment made by the EAC will be included in the clinical trial report as well as the assessments made by the investigator. However, the adjudication made by the EAC, given its independent analysis of each event, will be attributed with greater importance of the two.

13 Case report forms

Novo Nordisk will provide a system for the eCRFs. This system and support services to the system will be provided by an external supplier.

Ensure that all relevant questions are answered, and that no empty data field exists. If a test or an assessment has not been done and will not be available, or if the question is irrelevant (e.g. is not applicable), indicate this according to the data entry instructions.

The following will be provided as paper case report forms (CRFs):

- Pregnancy forms

The following will be provided as paper CRFs to be used when access to the eCRF is revoked or if the eCRF is unavailable:

- AE forms
- SIFs
- Technical complaint forms (also to be used to report complaints that are not subject related [e.g. discovered at trial site before allocation])

On the paper CRF forms print legibly, using a ballpoint pen. Ensure that all questions are answered, and that no empty data blocks exist. Ensure that no information is recorded outside the data blocks. If a test/assessment has not been done and will not be available, indicate this by writing “ND” (not done) in the appropriate answer field in the CRF. If the question is irrelevant (e.g. is not applicable) indicate this by writing “NA” (not applicable) in the appropriate answer field. Further guidance can be obtained from the instructions in the CRF.

The investigator must ensure that all information is consistent with the source documentation. By electronically signing the case book in the eCRF, the investigator confirms that the information in the eCRF and related forms is complete and correct.

13.1 Corrections to case report forms

Corrections to the eCRF data may be made by the investigator or the investigator’s delegated staff. An audit trail will be maintained in the eCRF application containing as a minimum: the old and the new data, identification of the person entering the data, date and time of the entry and reason for the correction.

If corrections are made by the investigator’s delegated staff after the date the investigator has signed the case book, the case book must be signed and dated again by the investigator.

13.2 Case report form flow

The investigator must ensure that data is recorded in the eCRF as soon as possible, preferably within 5 days after the visit. Once data has been entered, it will be available to Novo Nordisk for data verification and validation purposes.

At the end of the trial, the investigator must ensure that all remaining data have been entered into the eCRF no later than 3 days after LSLV at the site in order to ensure the planned lock of the database.

Site specific eCRF data (in an electronic readable format) will be provided to the trial site before access to the eCRF is revoked. This data must be retained at the trial site. When the final CTR is available, the data will be archived by Novo Nordisk A/S.

14 Monitoring procedures

During the course of the trial, the monitor will visit the trial site to ensure that the protocol is adhered to, that all issues have been recorded, to perform source data verification and to monitor drug accountability. The first monitoring visit will be performed as soon as possible after FSFV at the trial site and no later than 4 weeks after. The monitoring visit intervals will depend on the outcome of the remote monitoring of the eCRFs, the trial site's recruitment rate and the compliance of the trial site to the protocol and GCP, but will not exceed 12 weeks until LSLV at the trial site (for trial sites with active subjects [defined as subjects in screening, treatment or follow-up]).

The monitor must be given direct access to all source documents (original documents, data and records). Direct access includes permission to examine, analyse, verify and reproduce any record(s) and report(s) that are important to the evaluation of the trial. If the electronic medical record does not have a visible audit trail, the investigator must provide the monitor with signed and dated printouts. In addition the relevant trial site staff should be available for discussions at monitoring visits and between monitoring visits (e.g. by telephone).

All data must be verifiable in source documentation other than the eCRF.

For all data recorded the source document must be defined in a source document agreement at each trial site. There must only be one source defined at any time for any data element.

Source data generated by the trial site can be corrected by another person than the person entering the source data; any correction must be explained, signed and dated by the person making the correction.

The original of the completed diaries and/or PROs must not be removed from the trial site, unless they form part of the CRF/eCRF and a copy is kept at the site.

The monitor will ensure that the eCRFs are completed and that paper CRFs are collected.

The following data will be source data verified for screening failures:

- Date for obtaining informed consent
- Reason for screening failure

Monitors will review the subject's medical records and other source data (e.g. the diaries and PROs) to ensure consistency and/or identify omissions compared to the eCRF. If discrepancies are found, the investigator must be questioned about these.

A follow-up letter (paper or electronic) will be sent to the investigator following each monitoring visit. This should address any action to be taken.

15 Data management

Data management is the responsibility of Novo Nordisk. Data management may be delegated under an agreement of transfer of responsibilities to a contract research organisation (CRO).

Appropriate measures, including encryption of data files containing person identifiable data, will be used to ensure confidentiality of subject data, when they are transmitted over open networks.

Data from central laboratories will be transferred electronically. In cases where data is transferred via non-secure electronic networks, data will be encrypted during transfer.

The subject and any biological material obtained from the subject will be identified by subject number and trial ID. Appropriate measures such as encryption or leaving out certain identifiers will be enforced to protect the identity of subjects in all presentations and publications as required by local, regional and national requirements.

16 Computerised systems

Novo Nordisk will capture and process clinical data using computerised systems that are described in Novo Nordisk Standard Operating Procedures and IT architecture documentation. The use and control of these systems are documented.

Investigators working on the trial may use their own electronic systems to capture source data.

17 Statistical considerations

General considerations

If necessary, a statistical analysis plan (SAP) may be written in addition to the protocol, including a more technical and detailed elaboration of the statistical analyses. The SAP will be finalised before database lock.

The blinding of the randomised treatments will be maintained until the database has been released for statistical analysis. No interim analyses will be performed before the database is locked.

Data from all sites will be analysed and reported together.

In statistical analyses where stratification is included, the pre-trial OAD treatment at screening (yes/no) will be included based on the actual information collected through the eCRF. In case of missing eCRF information the information collected from the IWRS system will be used. In the statistical analyses the stratification factor will refer to pre-trial OAD treatment at screening.

The latest available measurement, at or prior to the randomisation visit, will be used as the baseline measurement. If no measurement(s) have been obtained, at or prior to randomisation, the baseline value will be left missing.

Laboratory values below the lower limit of quantification (LLoQ) will be set to $\frac{1}{2}$ LLoQ. Number of values below LLoQ by treatment and visit will be summarised if deemed relevant.

The primary efficacy endpoints will be evaluated at week 26. This approach will result in a lower proportion of missing data, use of rescue medication and premature treatment discontinuation, compared to the expected proportion of missing data at week 52 and therefore considered a meaningful representation and confirmation of the dose-response relationship of oral semaglutide.

Results from a statistical analysis will as a minimum be presented by the estimated treatment contrasts for the below six comparisons with associated two-sided 95% confidence intervals and p-values corresponding to two-sided tests of no difference:

- oral semaglutide 14 mg vs. placebo
- oral semaglutide 14 mg vs. liraglutide 0.9 mg
- oral semaglutide 7 mg vs. placebo
- oral semaglutide 7 mg vs. liraglutide 0.9 mg
- oral semaglutide 3 mg vs. placebo
- oral semaglutide 3 mg vs. liraglutide 0.9 mg

If no statistical analysis is specified, data will be presented using relevant summary statistics.

Primary and secondary estimands

Two estimands addressing different aspects of the trial objective will be defined; a primary de-jure (efficacy) estimand and a secondary de-facto (effectiveness) estimand:

- Primary estimand
 - de-jure treatment difference (oral semaglutide versus placebo and oral semaglutide versus liraglutide) at week 26 in all randomised subjects if all subjects adhered to treatment and did not initiate rescue medication

The primary de-jure estimand assesses the expected glycaemic benefit under adherence to trial product and is considered the primary interest for evaluating the dose-response relationship of oral semaglutide. Generalisation of this estimand depends among other things on the extent to which the adherence to trial product administration in this trial reflects the behaviour of the target population. Accordingly, only data collected prior to discontinuation of trial product or initiation of rescue medication will be used to draw inference. This will avoid confounding from rescue medication.

- Secondary estimand
 - de-facto treatment difference (oral semaglutide versus placebo and oral semaglutide versus liraglutide) at week 26 in all randomised subjects regardless of discontinuation of trial product or initiation of rescue medication(s)

The secondary de-facto estimand assesses the expected glycaemic benefit in a future population that results from subjects initiating treatment with oral semaglutide including potential rescue medication(s). Generalisation of this estimand depends among other things on the extent to which the use of rescue medication in this trial reflects clinical practice and the adherence to trial product administration in this trial reflects the behaviour of the target population. Accordingly, data collected regardless of discontinuation of trial product or initiation of rescue medication(s) will be used to draw inference.

Missing data considerations

Based on the results from similar Japanese phase 3 trials investigating liraglutide and s.c. semaglutide as monotherapy (NN2211-1700, NN9535-4091 and NN9535-4092) and the oral semaglutide phase 2 trial (NN9924-3790), it is expected that maximum 30% of the subjects will discontinue trial product or withdrawal from the trial at week 52.

When estimating the secondary estimand, the proportion of subject with missing data, i.e., data that do not exist even though subjects are intended to stay in the trial regardless of treatment status and initiation of rescue medication is expected to be maximum 10% based on the oral semaglutide phase 2 trial (NN9924-3790). Thus, missing data will mainly be due to withdrawal from trial or lost to follow-up.

When estimating the primary estimand, the proportion of subject with missing data is expected to be higher (20%) than for the secondary estimand because data collected after discontinuation of trial product or initiation of rescue medication(s) will be set to missing. The proportion of subject with missing data at week 26 is expected to be maximum 20% based on the liraglutide phase 3 trial (NN2211-1700), s.c. semaglutide phase 3 trials (NN9535-4091 and NN9535-4092) and the oral semaglutide phase 2 trial (NN9924-3790).

Across treatment arms the main reasons for missing data are expected to be early treatment discontinuation due to AEs (gastrointestinal AEs for oral semaglutide and liraglutide) and initiation of rescue medication. Initiation of rescue medication is expected to be more frequent in the placebo arm than for the oral semaglutide and liraglutide arms. A higher proportion of subjects are expected to discontinue treatment due to AEs in the oral semaglutide and liraglutide arms, compared to the placebo arm. So overall the frequency of missing data is expected to be similar across treatment arms.

Descriptive summaries and graphical representation of extent, reason(s) for and pattern of missing data will be presented by treatment arm.

17.1 Sample size calculation

The total sample size of 240 subjects and duration of this trial have been determined to allow for adequate (i) evaluation of the dose-response relationship and (ii) safety evaluation in a monotherapy setting in line with the Japanese draft AD guideline²⁷. With a maximum expected premature treatment discontinuation rate of 30% after week 52, this trial ensures that at least 100 subjects are exposed to oral semaglutide for one year.

Based on 48 subjects per treatment arm and a standard deviation of 1.1% in change from baseline to week 26 in HbA_{1c}, the width of the 95% confidence interval (precision) for the mean difference in HbA_{1c} will at most be +/- 0.5 %-point with 90% probability.

Furthermore, with 48 subjects per treatment arm the trial will be able to show a significant HbA_{1c} treatment difference of 0.74 %-point with 90% power and a treatment difference of 0.64 %-point with 80% power. As a reference, the assumed treatment effects (TE) and adjusted treatment effects are presented in [Table 17-1](#). These are based on the oral semaglutide phase 2 results (NN9924-3790) and supported by results from the s.c. semaglutide phase 2 trial (NN9535-1821).

The adjustment of the treatment effects are done differently when estimating the primary and the secondary estimand, due to the different analyses and the inclusion of data collected after treatment discontinuation and initiation of rescue medication for the secondary estimand. The treatment effects will be adjusted according to a 50% smaller effect in subjects with missing data when estimating the primary estimand. Whereas a 75% smaller effect will be used for the 10% of the

subjects who are expected to discontinue trial product or initiate rescue medication and for the 10% of subjects who are expected to have missing data when estimating the secondary estimand.

- Primary estimand
 - Adjusted TE = $0.8 \times \text{TE} + 0.2 \times \text{TE} \times 0.50$
- Secondary estimand
 - Adjusted TE = $0.8 \times \text{TE} + 0.1 \times \text{TE} \times 0.25 + 0.1 \times \text{TE} \times 0.25$

Table 17–1 Treatment effects in HbA_{1c} (%-point)

Oral semaglutide	3 mg	7 mg	14 mg
Treatment effects (TE)	0.45	0.75	1.0
Primary estimand: Adjusted TE	0.405	0.675	0.9
Secondary estimand: Adjusted TE	0.3825	0.6375	0.85

17.2 Definition of analysis sets

The following analysis sets will be defined:

Full analysis set (FAS): Includes all randomised subjects. Subjects in the FAS will contribute to the evaluation “as randomised”.

Safety analysis set (SAS): Includes all subjects exposed to at least one dose of trial product. Subjects in the SAS will contribute to the evaluation based on the trial product received for the majority of the period where treated. This will be referred to as contributing to the evaluation “as treated”.

Data selections and observation periods

Unless subjects withdraw their informed consent, data collection will continue for the full duration of the trial. The full duration of the trial is defined as up to and including:

- The follow-up visit (V13) for subjects on trial product
- The latest occurring visit of the end-of-treatment visit (V12) or the follow-up premature discontinuation visit (V13A), for subjects who have discontinued trial product prematurely

Subjects and data to be used in an analysis will be selected in a two-step manner:

- Firstly, subjects will be selected based on the specified analysis set
- Secondly, data points on the selected subjects from first step will be selected based on the specified observation period

Definition of the observation periods

In-trial: This observation period represents the time period where subjects are considered to be in the trial, regardless of discontinuation of trial product or initiation of rescue medication. The in-trial observation period starts at randomisation (as registered in IWRS) and ends at the date of:

- The last direct subject-site contact, which is scheduled to take place 5 weeks after planned last dose of trial product at a follow-up visit
- Withdrawal for subjects who withdraw their informed consent
- The last subject-investigator contact as defined by the investigator for subjects who are lost to follow-up
- Death for subjects who dies before any of the above

On-treatment: This observation period represents the time period where subjects are considered treated with trial product. The observation period is a subset of the in-trial observation period. It starts at the date of first dose of trial product. Two slightly different end dates will be needed to cover all assessments appropriately. For adjudicated events, ECGs, anti-semaglutide antibodies and AEs including hypoglycaemic episodes, the observation period ends at the first date of any of the following:

- The follow-up visit (V13)
- The follow-up prematurely discontinuation visit (V13A)
- The last date on trial product + 38 days
- The end-date for the in-trial observation period

The follow-up visit is scheduled to take place 5 weeks after the last date on trial product corresponding to approximately five half-lives of oral semaglutide. The visit window for the follow-up visit is +3 days.

For efficacy and other safety assessments (laboratory assessments, physical examination and vital signs) the observation period ends at the last date on trial product +3 days. This will be used in order to ensure specificity to reversible effects of treatment.

On-treatment without rescue medication: This observation period is a subset of the on-treatment observation period, where subjects are considered treated with trial product, but have not initiated any rescue medications. Specifically it starts at date of first dose of trial product and the observation period ends at the first date of:

- The last dose of trial product +3 days
- Initiation of rescue medication

The in-trial observation period will be the primary observation period when estimating the secondary estimand. The on-treatment without rescue medication observation period will be the primary observation period when estimating the primary estimand. The on-treatment observation

period will be considered supportive for evaluating efficacy. Safety will be evaluated based on the in-trial and the on-treatment observation periods.

Data points collected outside an observation period will be treated as missing in the analysis. Baseline data will always be included in an observation period. For adjudicated events, the onset date will be the EAC adjudicated onset date.

Before data are locked for statistical analysis and the randomisation code is broken, a review of all data will take place. Any decision to exclude either a subject or single observations from the statistical analysis is the joint responsibility of the members of the Novo Nordisk study group. Exclusion of data from analyses should be used restrictively, and normally no data should be excluded from the FAS. The subjects or observations to be excluded, and the reasons for their exclusion must be documented and signed by those responsible before database lock. The subjects and observations excluded from analysis sets, and the reason for this, will be described in the clinical trial report.

17.3 Primary endpoint

The primary endpoint is change from baseline to week 26 in HbA_{1c}.

17.3.1 Analysis for the primary estimand

The primary estimand will be estimated based on the FAS using post-baseline measurements up to and including week 26 from the on-treatment without rescue medication observation period.

The dose-response will be evaluated by a mixed model for repeated measurements (MMRM). A restricted maximum likelihood will be used. The model will include all post-baseline HbA_{1c} measurements collected at scheduled visits up to and including week 26 as dependent variables. The independent effects included in the model will be treatment and stratification factor as categorical fixed effects and baseline HbA_{1c} as a covariate, all nested within visit. An unstructured covariance matrix for HbA_{1c} measurements within the same subject will be employed, assuming measurements from different subjects are independent. From this analysis estimated differences with corresponding two sided p-values and 95% confidence intervals after 26 weeks of treatment will be presented for all pairwise comparison of oral semaglutide versus placebo. In addition to the dose-response evaluation, oral semaglutide will be compared to liraglutide 0.9 mg and estimated differences with corresponding two sided p-values and 95% confidence intervals after 26 weeks of treatment will be presented for all pairwise comparison of oral semaglutide versus liraglutide 0.9 mg.

The MMRM is a well-established method that accounts for the uncertainty pertaining to missing data. This analysis assumes that the missing data mechanism is MAR. Under this assumption the

statistical behaviour of the missing data (given the observed responses and model fixed effects and covariates) is assumed to be same as the observed data.

The dose-response relationship of oral semaglutide will be supported by an exploratory analysis. In this model data from all oral semaglutide treatment arms will be included and data from the placebo arm (corresponding to a dose of zero mg) could be included if appropriate. The model will be developed ad hoc after unblinding of the trial to aim for a suitable fit of the dose-response relationship using e.g. a linear or a four-parameter logistic relation of HbA_{1c} vs. the logarithm of the dose.

17.3.2 Analysis for the secondary estimand

The secondary estimand will be estimated based on the FAS using week 26 measurements from the in-trial observation period. The statistical analysis for the secondary estimand will be a pattern mixture model using multiple imputation to handle missing data assuming that the missing data mechanism is missing at random (MAR) within the groups used for imputation. Imputation of missing data at week 26 will be done within 10 groups of subjects defined by randomised treatment arm, and whether subjects at week 26; (i) have discontinued treatment or initiated rescue medication or (ii) are still on treatment and have not initiated rescue medication. It is hereby assumed that the likely values of what the missing data would have been if available are best described by information from subjects who at week 26 are similar in terms of randomised treatment arm and treatment adherence/rescue medication status.

Missing values for each group will be imputed as follows:

- An analysis of covariance (ANCOVA) with stratification factor as a categorical fixed effect and baseline HbA_{1c} measurement as a covariate will be fitted to observed values of the change from baseline in HbA_{1c} at week 26.
- The estimated parameters for location and dispersion will be used to impute 100 values for each subject with missing week 26 data based on stratification factor and baseline HbA_{1c}. Thus, 100 complete data sets will be generated including observed and imputed values.

Analysis used for testing superiority versus placebo at week 26:

For each of the 100 (now complete) imputed data sets the change from baseline to week 26 in HbA_{1c} will be analysed using an analysis of covariance (ANCOVA) with treatment and stratification factor as categorical fixed effects and baseline HbA_{1c} as covariate. The results obtained from analysing the datasets will be combined using Rubin's rule⁴⁷ to draw inference.

From this analysis the estimated treatment differences between each of the oral semaglutide dose levels and placebo together with associated two-sided 95% CIs and unadjusted two-sided p-values will be presented for all pairwise comparison of oral semaglutide versus placebo. In addition to this analysis, oral semaglutide will be compared to liraglutide 0.9 mg and estimated differences with

corresponding two sided p-values and 95% confidence intervals after 26 weeks of treatment will be presented for all pairwise comparison of oral semaglutide versus liraglutide 0.9 mg.

17.4 Secondary endpoints

17.4.1 Supportive secondary endpoints

17.4.1.1 Efficacy endpoints

The below supportive secondary efficacy endpoints will be evaluated for:

- The primary estimand based on FAS using the on-treatment without rescue medication observation period
- The secondary estimand based on FAS using the in-trial observation period

Continuous efficacy endpoints

Change from baseline to week 52 in:

- HbA_{1c}

Change from baseline to week 26 and week 52 in:

- FPG
- Body weight (kg)
- Body weight (%)
- BMI
- Waist circumference
- Fasting lipid profile (total cholesterol, LDL cholesterol, HDL cholesterol and triglycerides, VLDL, free fatty acids)
- Fasting insulin, C-peptide, glucagon, pro-insulin
- Pro-insulin/insulin ratio
- Insulin resistance (HOMA-IR)
- Beta-cell function (HOMA-B)

BMI will be calculated based on body weight and height based on the formulae:

$$\text{BMI kg/m}^2 = \text{body weight (kg)} / (\text{height (m)} \times \text{height (m)}) \text{ or } (\text{kg/m}^2 = [\text{lb/in}^2 \times 703])$$

Change from baseline to week 26 and 52 in the below derived endpoints from the 7-point SMPG profile:

- Mean 7-point profile, defined as the area under the profile, calculated using the trapezoidal method, divided by the measurement time
- Mean postprandial increment over all meals

The above continuous endpoints will be analysed separately using similar model approaches as for the primary endpoint with the associated baseline response as a covariate. Fasting lipid profile endpoints will be log-transformed prior to analysis with the associated log-transformed baseline value as a covariate. No model development of dose-response relationship is planned for these.

For evaluation of the primary estimand the MMRM based primary analysis will include all scheduled post-baseline measurement up to and including week 52. From this analysis the estimated treatment differences (ratios) between each of the oral semaglutide dose levels and placebo at week 26 and 52 and between each of the oral semaglutide dose levels and liraglutide 0.9 mg at week 26 and week 52 together with associated two-sided 95% CIs and unadjusted two-sided p-values will be presented for all pairwise comparison of oral semaglutide versus placebo and versus liraglutide 0.9 mg.

For evaluation of the secondary estimand the analysis will be performed separately for week 26 and 52. For the analysis at week 52, the imputation of missing data will be further differentiated by whether subjects have discontinued trial product or initiated rescue medication prior to week 26 or at or after week 26. This will result in imputation of missing data within 20 groups of subjects instead of the 10 groups as described for the week 26 evaluation in Section [17.3.2](#). If less than 5 subjects have available data in one of the 20 groups, the imputation will be made within the 10 groups specified for the primary evaluation. The frequency of missing data is expected to be slightly larger at week 52 compared to week 26. The rate of missing data is expected to decline over time.

Binary efficacy endpoints

If a subject after week 26 achieves (yes/no):

- HbA_{1c} <7.0% (53 mmol/mol) (ADA target)
- HbA_{1c} ≤6.5% (48 mmol/mol) (AACE target)
- HbA_{1c} reduction ≥1%-point (10.9 mmol/mol)
- Body weight loss ≥3%
- Body weight loss ≥5%
- Body weight loss ≥10%
- HbA_{1c} <7.0% (53 mmol/mol) without hypoglycaemia (treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes) and no body weight gain
- HbA_{1c} reduction ≥1%-point (10.9 mmol/mol) and body weight loss ≥3%

The above eight endpoints will also be evaluated after week 52.

The above eight binary endpoints will be analysed separately using a logistic regression model with treatment and stratification factor as fixed effects and baseline response as covariate (i.e. baseline HbA_{1c} for binary HbA_{1c} endpoints, baseline body weight for body weight endpoints and both baseline HbA_{1c} and baseline body weight for the binary endpoints that combines both parameters).

To account for missing data, the analysis will be made using a sequential multiple imputation approach as described below:

- Multiple imputed data sets (100) will be created in which missing values for the underlying continuous assessments are imputed by treatment group and treatment adherence/rescue status assuming MAR and as described in section [17.3.2](#) for the secondary estimand and by treatment group assuming MAR and as described in section [17.3.1](#) for the primary estimand.
- The binary endpoint will be created for each of the 100 complete data sets
- Each of the created complete data set will be analysed with the logistic model and inference will be drawn using Rubin's rule⁴⁷.

Time to event endpoint

- Time to rescue medication

The endpoint will be analysed based on FAS using both the on-treatment observation period and the in-trial observation period. For the analysis based on the on-treatment observation period, subject without need for rescue medication during the on-treatment observation period will be censored at the time point of the date of last trial product. For the in-trial period subject without need for addition of glucose-lowering medication during the in-trial observation period, will be censored at the time point of the date of end of the in-trial observation period. For this analysis, the follow-up period will be excluded from the in-trial observation period, since subjects will have to stop treatment at the end-of-treatment visit and therefore might need addition of glucose-lowering medication during the follow-up period.

The endpoint will be described and compared for oral semaglutide versus placebo and versus liraglutide 0.9 mg using likelihood ratio tests obtained from a Cox proportional hazards model with treatment and stratification factor as categorical fixed effects and baseline HbA_{1c} as a covariate. From this analysis the estimated Hazard ratios between each of the oral semaglutide dose levels and placebo and between each of the oral semaglutide dose levels and liraglutide 0.9 mg together with associated two-sided 95% CIs and unadjusted two-sided p-values will be presented for all pairwise comparison of oral semaglutide versus placebo and versus liraglutide 0.9 mg.

17.4.1.2 Safety endpoints

The safety endpoints will be evaluated based on SAS using the on-treatment observation period and based on SAS using the in-trial observation period unless otherwise stated. The following endpoints are used to support the safety objectives.

Adverse events

- Number of TEAEs during exposure to trial product, assessed up to approximately 57 weeks

All AEs will be coded using the most recent version of the Medical Dictionary for Regulatory Activities (MedDRA) coding.

A treatment-emergent AE is defined as an AE with onset in the on-treatment observation period (see definition of observation periods in Section [17.2](#)).

TEAEs will be summarised in terms of the number of subjects with at least one event (N), the percentage of subjects with at least one event (%), the number of events (E) and the event rate per 100 patient years of observation time (R) for the on-treatment observation period. Supportive summaries of AEs will be made for the in-trial observation period. The development over time in gastrointestinal AEs will be presented graphically.

Other safety endpoints

Change from baseline to week 26 and 52 in:

- Amylase
- Lipase
- Pulse
- Systolic blood pressure
- Diastolic blood pressure

The above safety endpoints will be evaluated using the primary analysis for the secondary estimand based on SAS using the in-trial observation period and using the primary analysis for the primary estimand based on SAS using the on-treatment observation period. Endpoints will be analysed separately as described above for continuous efficacy endpoints. Results will be presented at week 26 and 52. Amylase and lipase endpoints will be log-transformed prior to analysis with the associated log-transformed baseline value as a covariate.

Change from baseline to week 26 and 52 in:

- Haematology
- Biochemistry (except for amylase and lipase)
- Calcitonin
- ECG category
- Physical examination

Change from baseline to week 52 in:

- Fundus photography/dilated fundoscopy

Occurrence of anti-semaglutide antibodies (yes/no):

- Anti-semaglutide binding antibodies
- Anti-semaglutide neutralising antibodies

- Anti-semaglutide binding antibodies cross reacting with native GLP-1
- Anti-semaglutide neutralising antibodies cross reacting with native GLP-1

Anti-semaglutide antibodies:

- Anti-semaglutide binding antibody levels

The above safety endpoints will be summarised descriptively by treatment arm and visit. Categorical safety endpoints will be summarised as counts and relative frequencies. Calcitonin will also be presented by gender.

Hypoglycaemia

- Number of treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes during exposure to trial product, assessed up to approximately 57 weeks
- Treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes during exposure to trial product, assessed up to approximately 57 weeks (yes/no)

Classification of hypoglycaemia

Hypoglycaemic episodes will be summarised for the SAS and the on-treatment observation period only.

Treatment emergent: hypoglycaemic episodes will be defined as treatment-emergent if the onset of the episode occurs within the on-treatment observation period (see definition of observation periods in Section [17.2](#)).

Nocturnal hypoglycaemic episodes: episodes occurring between 00:01 and 05.59 both inclusive.

Hypoglycaemic episodes are classified according to the Novo Nordisk classification of hypoglycaemia and the ADA classification of hypoglycaemia (see Figure [17.1](#)).

Novo Nordisk classification of hypoglycaemia

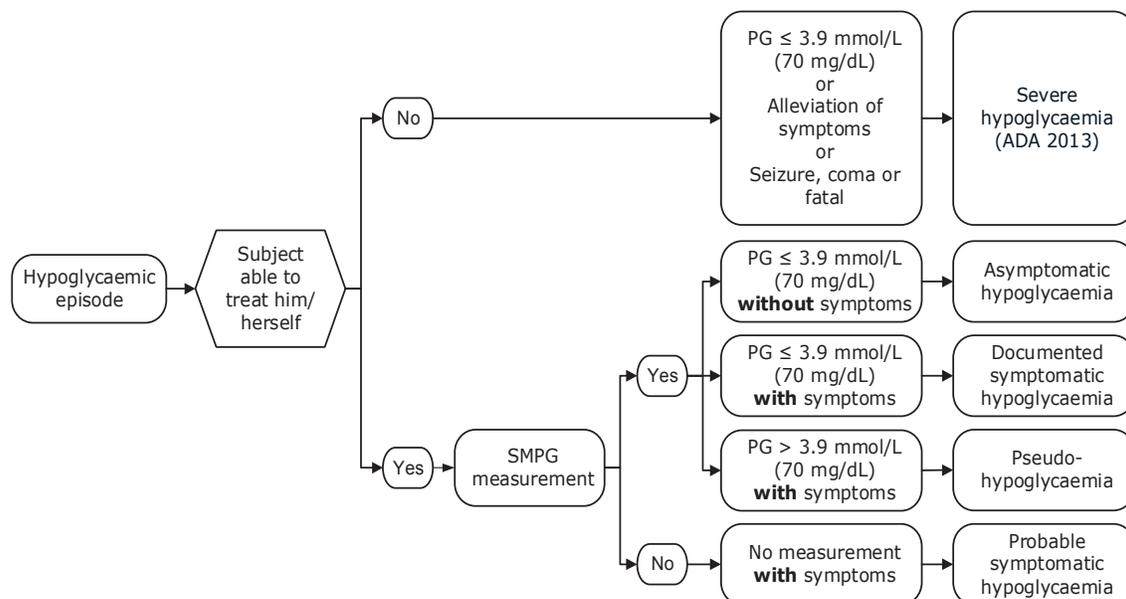

In normal physiology, symptoms of hypoglycaemia occur below a PG level of 3.1 mmol/L (56 mg/dL)⁴⁸. Therefore, Novo Nordisk has included hypoglycaemia with PG levels below this cut-off point in the definition of BG confirmed hypoglycaemia.

Novo Nordisk uses the following classification in addition to the ADA classification:

- Severe or BG confirmed symptomatic hypoglycaemia: An episode that is severe according to the ADA classification⁴⁰ or BG confirmed by a PG value < 3.1 mmol/L (56 mg/dL) **with** symptoms consistent with hypoglycaemia.

ADA classification⁴⁰ of hypoglycaemia

- Severe hypoglycaemia: An episode requiring assistance of another person to actively administer carbohydrate, glucagon, or take other corrective actions. PG concentrations may not be available during an event, but neurological recovery following the return of PG to normal is considered sufficient evidence that the event was induced by a low PG concentration.
- Asymptomatic hypoglycaemia: An episode not accompanied by typical symptoms of hypoglycaemia, but with a measured PG concentration ≤ 3.9 mmol/L (70 mg/dL).
- Documented symptomatic hypoglycaemia: An episode during which typical symptoms of hypoglycaemia are accompanied by a measured PG concentration ≤ 3.9 mmol/L (70 mg/dL).
- Pseudo-hypoglycaemia: An episode during which the person with diabetes reports any of the typical symptoms of hypoglycaemia with a measured PG concentration > 3.9 mmol/L (70 mg/dL) but approaching that level.
- Probable symptomatic hypoglycaemia: An episode during which symptoms of hypoglycaemia are not accompanied by a PG determination but that was presumably caused by a PG concentration ≤ 3.9 mmol/L (70 mg/dL).

Note: Glucose measurements are performed with capillary blood calibrated to plasma equivalent glucose values

PG: plasma glucose SMPG: Self-measured plasma glucose

Figure 17–1 ADA classification of hypoglycaemia

Data on treatment-emergent hypoglycaemic episodes will be presented in terms of the number of subjects with at least one episode, the percentage of subjects with at least one episode (%), the total number of episodes and the episode rate per 100 patient years of observation time.

Analysis of severe or BG-confirmed symptomatic hypoglycaemic endpoints

The number of treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episodes will be evaluated for the on-treatment period using a negative binomial regression model with a log-link function and the logarithm of the duration of the subject's on-treatment observation period as offset. The model will include treatment and stratification factor as fixed factors and baseline HbA_{1c} as covariate.

The binary endpoint showing whether a subject has at least one treatment-emergent severe or BG-confirmed symptomatic hypoglycaemic episode will be analysed using a logistic regression model with treatment and stratification factor as fixed factors and baseline HbA_{1c} as covariate.

17.4.1.3 Pharmacokinetic endpoints

- Semaglutide plasma concentrations for population PK analysis

The semaglutide plasma concentrations collected in this trial will be evaluated using relevant summary statistics. In addition, the semaglutide plasma concentration will be part of a meta-analysis across the oral semaglutide phase 3a trials, see more details in Section [17.6](#).

17.5 Interim analysis

No interim analyses or other analyses of unblinded data will be performed before the database is locked.

17.6 Pharmacokinetic and/or pharmacodynamic modelling

Data from this trial will be evaluated using population pharmacokinetic analysis and exposure-response for semaglutide. The purpose of the population pharmacokinetic analysis will be:

- To describe the covariate factors (such as body weight, age, gender, race and ethnicity) that influence semaglutide exposure
- To estimate a steady-state exposure level for each subject with pharmacokinetic data, in order to facilitate subsequent exposure-response analyses

The purpose of the exposure-response analyses will be to support the recommended dose, by investigating response and potentially side effects across the exposure range.

The population pharmacokinetic and exposure-response analyses will be conducted as a meta-analysis, including all relevant oral semaglutide phase 3a trials with PK assessments. A separate modelling analysis plan will be prepared before first database lock in the oral semaglutide phase 3a

programme, outlining details of the analyses. The modelling will be performed by Quantitative Clinical Pharmacology at Novo Nordisk A/S and will be reported separately from the clinical trial report.

17.7 Health economics and/or patient reported outcomes

PRO endpoints

Change from baseline to week 26 and week 52 in:

- SF-36v2TM (acute version) health survey: Total score and scores from the 8 domains
- DTR-QOL questionnaire: Total score and scores from the 4 factors

The PRO endpoints will be analysed separately as the other continuous efficacy endpoints using a similar model approach as for the primary endpoint with the associated baseline response as a covariate.

18 Ethics

18.1 Benefit-risk assessment of the trial

18.1.1 Risks and precautions with oral semaglutide

The nonclinical safety programme of oral semaglutide has not revealed any safety issues precluding use in humans.

The sections below describe the important identified and potential risks and precautions associated with oral semaglutide treatment. These are based on findings in nonclinical studies and clinical trials with oral semaglutide as well as other GLP-1 RAs. For each of these risks and precautions, mitigating actions have been implemented to minimise the risks for subjects enrolled in this trial.

Identified risks

Gastrointestinal adverse events

Consistent with findings with other GLP-1 RAs, the most frequently reported AEs in clinical trials with oral semaglutide have been gastrointestinal disorders (nausea, vomiting, diarrhoea, dyspepsia and constipation). Clinical trials have indicated that a low starting dose and gradual dose escalation mitigates the risk of gastrointestinal AEs. Consequently, a low starting dose and dose escalation with 4 week dose-escalation steps have been implemented in the trial.

Potential risks

Medullary thyroid cancer

The human relevance of the proliferative C-cell changes found in rodents treated with GLP-1 RAs is unknown, but data suggest that rodents are more sensitive to the mode of action of GLP-1 RAs for induction of C-cell tumours. However, as a precaution, subjects with a family or personal history of MEN 2 or MTC will not be enrolled in the trial. During the trial, calcitonin will be measured on a regular basis, and the guidance for investigators on further evaluation and action on elevated calcitonin concentrations is included in appendix A.

Acute pancreatitis

Acute pancreatitis has been reported in subjects treated with GLP-1 RAs including oral semaglutide. As a precaution, subjects with a history of acute or chronic pancreatitis will not be enrolled in the trial. Also, subjects will be informed about the symptoms of acute pancreatitis and serum levels of lipase and amylase will be monitored throughout the trial.

Pancreatic cancer

Patients with T2DM have an increased risk of certain types of cancer such as pancreatic cancer. There is currently no support from nonclinical studies or clinical trials or post-marketing data that GLP-1-based therapies increase the risk of pancreatic cancer. However, pancreatic cancer has been included as a separate potential risk due to the scientific debate surrounding a potential association to GLP-1-based therapies and the unknown long-term effects of stimulation of β -cells and suppression of α -cells. Pancreatic cancer has been classified as a potential class risk of GLP-1 RAs by EMA.

Allergic reactions

As in the case with all protein-based pharmaceuticals, treatment with oral semaglutide may evoke allergic reactions. These may include urticaria, rash, pruritus as well as anaphylactic reactions. As a precaution, subjects with known or suspected hypersensitivity to trial product(s) or related products will not be enrolled in the trial. In addition, subjects will be instructed to contact the site staff as soon as possible for further guidance if suspicion of a hypersensitivity reaction to the trial product occurs.

Hypoglycaemia

Based on current knowledge about the GLP-1 RA drug class, there is a risk of hypoglycaemic episodes. Hypoglycaemic episodes have mainly been observed when a GLP-1 RA is combined with sulphonylurea or insulin. The risk for development of hypoglycaemia with oral semaglutide in combination with sulphonylurea and insulin is currently unknown.

Acute renal impairment

In subjects treated with GLP-1 RAs, including oral semaglutide, gastrointestinal AEs such as nausea, vomiting and diarrhoea may lead to significant dehydration and secondary acute renal impairment. Subjects with gastrointestinal AEs are recommended to drink plenty of fluids to avoid volume depletion. Also, serum creatinine and other markers of kidney function will be monitored throughout the trial.

If rescue medication is indicated it should be in accordance with the current, approved labels.

SGLT-2 inhibitors, an allowed rescue medication, have also been associated with volume depletion. It is recommended to monitor renal function and for signs and symptoms of fluid loss during therapy. Severe dehydration may be a risk factor for ketoacidosis.

Impaired renal function may increase the risk of metformin-associated lactic acidosis when GLP-1 RAs are co-administered with metformin. In case subject is treated with metformin as a rescue medication and experiences prolonged or severe nausea and vomiting, the investigator should

monitor serum creatinine, and if clinically indicated, withhold metformin until resolution of renal dysfunction.

Other safety considerations

Diabetic retinopathy

A transient worsening of diabetic retinopathy is a recognised complication in selected patients with diabetes after initiation of intensive antidiabetic treatment^{49,50,51}. Risk factors for these events include long-standing poor glycaemic control and presence of proliferative retinopathy, and initial large improvements in blood glucose may be an additional aggravating factor. Several studies have, however, documented long-term beneficial effects of intensive glycaemic treatment in reducing retinopathy progression^{4,52} even in intensively treated patients who experienced early worsening⁵⁰. In a cardiovascular outcomes trial with s.c. semaglutide, results indicate an increased risk of events related to diabetic retinopathy in subjects treated with semaglutide compared to placebo. As a precaution in this trial, all subjects are required to have a fundus photography or dilated funduscopy performed before enrolment into the trial; moreover, subjects with proliferative retinopathy or maculopathy requiring acute treatment will be excluded.

Teratogenicity (embryo-foetal development toxicity)

Semaglutide caused embryo-foetal malformations in the rat through a GLP-1 receptor mediated effect on the inverted yolk sac placenta leading to impaired nutrient supply to the developing embryo. Primates do not have an inverted yolk sac placenta which makes this mechanism unlikely to be of relevance to humans. However, as a precaution, females who are pregnant, breast-feeding or intend to become pregnant or are of childbearing potential and not using an adequate contraceptive method will not be enrolled in the trial. In addition, pregnancy tests will be performed at all visits, including screening and follow-up and at any time during the trial if a menstrual period is missed.

General precautions

All subjects will be included after a thorough evaluation with regards to in- and exclusion criteria defined in order to ensure that subjects are eligible for trial treatment. There are also strict glycaemic rescue criteria in place to ensure acceptable glycaemic control during the trial. If rescue medication is required, it should be in accordance with ADA/European Association for the Study of Diabetes^{28,29} (excluding GLP-1 RAs, DPP-4 inhibitors and amylin analogues).

It is the responsibility of the investigator to ensure the best possible care according to clinical practice in Japan and/or the principles outlined in Diabetes Care 2016 Standards of Medical Care in Diabetes⁵³.

Further details with regards to safety of trial product are described in the current edition of the IB for oral semaglutide (NN9924)²⁵, or any updates thereto.

18.1.2 Risks and precautions with liraglutide

The most commonly reported side effects associated with liraglutide are nausea, diarrhoea, vomiting, other GI symptoms, nasopharyngitis, hypoglycaemia (when combined with SU or insulin), anorexia, headache, increased heart rate, dizziness, rash and injection site reactions. Also, dehydration, renal impairment and pancreatitis have been reported²⁶.

From clinical trials and marketed use, overdoses have been reported of up to 72 mg. Generally, the patients reported severe nausea, vomiting and diarrhoea. None of the patients reported severe hypoglycaemia. All patients recovered without complications.

In the event of overdose, appropriate supportive treatment should be initiated according to the patient's clinical signs and symptoms

18.1.3 Risks and precautions with placebo

There will be strict glycaemic rescue criteria in place to ensure acceptable glycaemic control for all treatment arms at all times during the trial. Subjects will in case of unacceptable, persistent hyperglycaemia be offered treatment intensification (rescue medication) at the discretion of the investigator.

18.1.4 Benefits

In this trial, subjects will be randomised 1:1:1:1:1 to either one of the 3 dose levels of semaglutide, liraglutide or placebo. The majority of the patients will be treated with a treatment regimen anticipated to be equally or more efficacious than the treatment they received at the time of trial entry. Based on the results of the phase 2 dose finding trial, oral semaglutide is expected to provide clinically relevant improvements in glycaemic control and body weight in subjects with T2DM. Similarly, treatment with liraglutide is expected to provide clinically relevant improvements in glycaemic control²⁶.

In addition, it is expected that all subjects, including subjects randomised to placebo, will benefit from participation through close contact with the trial site, with close follow-up of their T2DM and a careful medical examination; all of which will most likely result in an intensified management of their T2DM.

All subjects in this trial will receive trial products and auxiliary supplies free of charge.

18.1.5 Risk and benefit conclusion

The safety profile for oral semaglutide generated from the clinical and nonclinical development programme has not revealed any safety issues that would prohibit administration of oral semaglutide in accordance with the planned clinical trial.

The phase 2 results indicate that oral semaglutide will provide clinically relevant improvements in glycaemic control and body weight.

Liraglutide is already a marketed drug approved for the use in subjects with T2DM.

Safety and efficacy will be monitored regularly and acceptable glycaemic control will be reinforced at all times during the trial.

In conclusion, the potential risk to the subjects in this trial is considered low and acceptable in view of the anticipated benefits oral semaglutide/liraglutide would provide to subjects with T2DM.

18.2 Informed consent

In seeking and documenting informed consent, the investigator must comply with applicable regulatory requirement(s) and adhere to ICH GCP¹ and the requirements in the Declaration of Helsinki².

Before any trial-related activity, the investigator must give the subject verbal and written information about the trial and the procedures involved in a form that the subject can read and understand.

The subjects must be fully informed of their rights and responsibilities while participating in the trial as well as possible disadvantages of being treated with the trial products.

The investigator must ensure the subject ample time to come to a decision whether or not to participate in the trial.

A voluntary, signed and personally dated informed consent must be obtained from the subject before any trial-related activity.

The responsibility for seeking informed consent must remain with the investigator, but the investigator may delegate the task to a medically qualified person, in accordance with local requirements. The written informed consent must be signed and personally dated by the person who seeks the informed consent before any trial-related activity.

If information becomes available that may be relevant to the subject's willingness to continue participating in the trial, the investigator must inform the subject in a timely manner, and a revised written subject information must be provided and a new informed consent must be obtained.

In order to avoid missing data, the subjects will be informed about the importance of completing the trial also if the subjects discontinue from trial product.

18.3 Data handling

If the subject withdraws from the trial or is lost to follow-up, then the subject's data will be handled as follows:

- Data already collected and any data collected at the end-of-trial visit including follow-up visits will be retained by Novo Nordisk, entered into the database and used for the clinical trial report.
- Safety events will be reported to Novo Nordisk and regulatory authorities according to local/national requirements.

If data is used, it will always be in accordance with local regulations and IRBs.

18.4 Information to subjects during trial

All written information to subjects must be sent to IRB for approval/favourable opinion and to regulatory authorities for approval or notification according to local regulations.

18.5 Premature termination of the trial and/or trial site

Novo Nordisk, the IRBs or a regulatory authority may decide to stop the trial, part of the trial or a trial site at any time, but agreement on procedures to be followed must be obtained.

If the trial is suspended or prematurely terminated, the investigator must inform the subjects promptly and ensure appropriate therapy and follow-up. The investigator and/or Novo Nordisk must also promptly inform the regulatory authorities and IRBs and provide a detailed written explanation.

If, after the termination of the trial, the benefit-risk analysis changes, the new evaluation must be provided to the IRBs in case it has an impact on the planned follow-up of subjects who have participated in the trial. If it has an impact, the actions needed to inform and protect the subjects should be described.

19 Protocol compliance

19.1 Protocol deviations

Deviations from the protocol should be avoided.

If deviations do occur, the investigator must inform the monitor and the implications of the deviation must be reviewed and discussed.

Deviations must be documented and explained in a protocol deviation by stating the reason, date and the action(s) taken. Some deviations, for which corrections are not possible, can be acknowledged and confirmed via edit checks in the eCRF or via listings from the trial database.

Documentation on protocol deviations must be kept in the investigator trial master file and sponsor trial master file.

19.2 Prevention of missing data

The importance of subject retention will be addressed by Novo Nordisk in the training and communication with the trial sites.

The subjects will be carefully informed about the trial procedures before signing informed consent, so that they know the implications of participating in the trial.

Close surveillance of subject retention will be performed throughout the trial by Novo Nordisk with focus on reasons for premature discontinuation of trial product or withdrawal of consent to secure early mitigations in collaboration with the trial sites.

The investigator will make every effort to ensure that all assessments are performed and data is collected. If missing data does occur the reason will be collected via the protocol deviation process, see Section [19.1](#). Novo Nordisk will monitor protocol deviations on an on-going basis throughout the trial followed by appropriate actions (e.g. re-training of site staff).

20 Audits and inspections

Any aspect of the clinical trial may be subject to audits conducted by Novo Nordisk or inspections from domestic or foreign regulatory authorities or from IRBs. Audits and inspections may take place during or after the trial. The investigator and the site staff as well as Novo Nordisk staff have an obligation to cooperate and assist in audits and inspections. This includes giving auditors and inspectors direct access to all source documents and other documents at the trial site relevant to the clinical trial. This includes permission to examine, analyse, verify and reproduce any record(s) and report(s) that are relevant to the evaluation of the trial.

21 Critical documents

Before a trial site is allowed to start screening subjects, written notification from Novo Nordisk must be received and the following documents must be available to Novo Nordisk:

- Regulatory approval and/or acknowledgement of notification as required
- Approval/favourable opinion from IRBs clearly identifying the documents reviewed as follows: protocol, any protocol amendments, subject information/informed consent form, any other written information to be provided to the subject and subject recruitment materials
- List of IRB members and/or constitution (or a general assurance number/statement of compliance)
- Curricula vitae of investigator and sub-investigator(s) (current, dated and signed - must include documented GCP training or a certificate)
- Signed receipt of IB for oral semaglutide and s.c. semaglutide and package insert for liraglutide (Victoza[®])
- Signed and dated Agreement on Protocol
- Signed and dated Agreement on Protocol Amendment, if applicable
- Contract, signed by the investigator and/or appropriate parties on behalf of the investigator's site and Novo Nordisk.
- Source document agreement
- Central laboratory certification and normal ranges
- Insurance statement, if applicable
- Financial disclosure form from investigator and sub-investigator(s)

Novo Nordisk will analyse and report data from all sites together if more than one site is involved in the trial.

By signing the protocol agreement, each investigator agrees to comply fully with ICH GCP¹ applicable regulatory requirements and the Declaration of Helsinki².

By signing the protocol agreement, each investigator also agrees to allow Novo Nordisk to make investigator's name and information about site name and address publically available if this is required by national or international regulations.

It should be noted that a seal is accepted as signature in Japan.

22 Responsibilities

The investigator is accountable for the conduct of the trial at his/her site and must ensure adequate supervision of the conduct of the trial at the trial site. If any tasks are delegated, the investigator must maintain a log of appropriately qualified persons to whom he/she has delegated specified trial-related duties. The investigator must ensure that there is adequate and documented training for all staff participating in the conduct of the trial. It is the investigator's responsibility to supervise the conduct of the trial and to protect the rights, safety, and well-being of the subjects.

A qualified physician, who is an investigator or a sub-investigator for the trial, must be responsible for all trial-related medical decisions.

The investigator will follow instructions from Novo Nordisk when processing data.

The investigator is responsible for filing essential documents (i.e. those documents which individually and collectively permit evaluation of the conduct of a trial and the quality of the data produced) in the investigator trial master file. The documents including the subject identification code list must be kept in a secure locked facility, so no unauthorized persons can get access to the data.

The investigator will take all necessary technical and organisational safety measures to prevent accidental or wrongful destruction, loss or deterioration of data. The investigator will prevent any unauthorised access to data or any other processing of data against applicable law. The investigator must be able to provide the necessary information or otherwise demonstrate to Novo Nordisk that such technical and organisational safety measures have been taken.

During any period of unavailability, the investigator must delegate responsibility for medical care of subjects to a specific qualified physician who will be readily available to subjects during that time.

If the investigator is no longer able to fulfil the role as investigator (e.g. if he/she moves or retires), a new investigator will be appointed in consultation with Novo Nordisk.

The investigator and other site personnel must have sufficient English skills according to their assigned task(s).

23 Reports and publications

The information obtained during the conduct of this trial is considered confidential, and may be used by or on behalf of Novo Nordisk for regulatory purposes as well as for the general development of the trial product. All information supplied by Novo Nordisk in connection with this trial shall remain the sole property of Novo Nordisk and is to be considered confidential information.

No confidential information shall be disclosed to others without prior written consent from Novo Nordisk. Such information shall not be used except in the performance of this trial. The information obtained during this trial may be made available to other physicians who are conducting other clinical trials with the trial product, if deemed necessary by Novo Nordisk. Provided that certain conditions are fulfilled, Novo Nordisk may grant access to information obtained during this trial to researchers who require access for research projects studying the same disease and/or trial product studied in this trial.

Novo Nordisk may publish on its clinical trials website a redacted clinical trial report for this trial.

One or two investigators will be appointed by Novo Nordisk to review and sign the clinical trial report (signatory investigator) on behalf of all participating investigators. The signatory investigator(s) will be appointed based upon the criteria defined by the International Committee of Medical Journal Editors for research publications⁵⁴.

23.1 Communication of results

Novo Nordisk commits to communicating, and otherwise making available for public disclosure, results of trials regardless of outcome. Public disclosure includes publication of a paper in a scientific journal, abstract submission with a poster or oral presentation at a scientific meeting, or disclosure by other means.

The results of this trial will be subject to public disclosure on external web sites according to international and national regulations, as reflected in the Novo Nordisk Code of Conduct for Clinical Trial Disclosure³⁰.

Novo Nordisk reserves the right to defer the release of data until specified milestones are reached, for example when the clinical trial report is available. This includes the right not to release the results of interim analyses, because the release of such information may influence the results of the entire trial.

At the end of the trial, one or more scientific publications may be prepared collaboratively by the investigator(s) and Novo Nordisk. Novo Nordisk reserves the right to postpone publication and/or communication for up to 60 days to protect intellectual property.

In all cases the trial results will be reported in an objective, accurate, balanced and complete manner, with a discussion of the strengths and limitations. All authors will be given the relevant statistical tables, figures, and reports needed to evaluate the planned publication. In the event of any disagreement on the content of any publication, both the investigators' and Novo Nordisk opinions will be fairly and sufficiently represented in the publication.

Where required by the journal, the investigator from each trial site will be named in an acknowledgement or in the supplementary material, as specified by the journal.

Novo Nordisk maintains the right to be informed of plans by any investigator to publish and to review any scientific paper, presentation, communication or other information concerning the investigation described in this protocol. Any such communication must be submitted in writing to Novo Nordisk before submission for comments. Comments will be given within four weeks from receipt of the planned communication.

23.1.1 Authorship

Authorship of publications should be in accordance with the Uniform Requirements of the International Committee of Medical Journal Editors⁵⁴ (sometimes referred to as the Vancouver Criteria). Novo Nordisk will appoint investigator(s) to prepare publications in collaboration with Novo Nordisk.

23.1.2 Site-specific publication(s) by investigator(s)

For a multi-centre clinical trial, analyses based on single-site data usually have significant statistical limitations and frequently do not provide meaningful information for healthcare professionals or subjects, and therefore may not be supported by Novo Nordisk. It is a Novo Nordisk policy that such individual reports do not precede the primary manuscript and should always reference the primary manuscript of the trial.

Novo Nordisk reserves the right to prior review of such publications. Further to allow for the primary manuscript to be published as the first, Novo Nordisk asks for deferment of publication of individual site results until the primary manuscript is accepted for publication. As Novo Nordisk wants to live up to the industry publication policy, submission of a primary publication will take place no later than 18 months after trial completion.

23.2 Investigator access to data and review of results

As owner of the trial database, Novo Nordisk has the discretion to determine who will have access to the database.

Individual investigators will have their own research subjects' data, and will be provided with the randomisation code after results are available.

24 Retention of clinical trial documentation and human biosamples

24.1 Retention of clinical trial documentation

Subject's medical records must be kept for the maximum period permitted by the hospital, institution or private practice.

The investigator must agree to archive the documentation (this includes both electronic and paper-based records) pertaining to the trial in an archive after completion or discontinuation of the trial if not otherwise notified. The investigator should not destroy any documents without prior permission from Novo Nordisk. If the investigator cannot archive the documents at the trial site, Novo Nordisk can refer the investigator to an independent archive provider that has a system in place to allow only the investigator to access the files.

The investigator must be able to access his/her trial documents without involving Novo Nordisk in any way. Site-specific CRFs and other subject data (in an electronic readable format or as paper copies or prints) will be provided to the investigator before access is revoked to the systems and/or electronic devices supplied by Novo Nordisk. These data must be retained by the trial site. If the provided data (e.g. the CD-ROM) is not readable during the entire storage period, the investigator can request a new copy. A copy of all data will be stored by Novo Nordisk.

Novo Nordisk will maintain Novo Nordisk documentation pertaining to the trial for at least 20 years after discontinuation of the marketing authorisation, termination of the trial or cancellation of the research project whichever is longest.

The files from the trial site/institution must be retained for 15 years after end of trial as defined in Section 7, or longer if required by local regulations or Novo Nordisk. In any case trial files cannot be destroyed until the trial site/institution is notified by Novo Nordisk. The deletion process must ensure confidentiality of data and must be done in accordance with local regulatory requirements.

24.2 Retention of human biosamples

Antibody samples may be retained for later analysis for further characterisation of antibody responses towards drug if required by health authorities or for safety reasons.

The samples will be stored at a central bio-repository after end of trial and until marketing authorisation approval or until the research project terminates, but no longer than 15 years from end of trial after which they will be destroyed.

The subject's identity will remain confidential and the antibody samples will be identified only by subject number, visit number and trial identification number. No direct identification of the subject will be stored together with the samples.

Protocol
Trial ID: NN9924-4281
UTN: U1111-1181-4048

~~CONFIDENTIAL~~

Date:	23 September 2016	Novo Nordisk
Version:	2.0	
Status:	Final	
Page:	112 of 119	

Only Novo Nordisk staff and bio-repository personnel will have access to the stored antibody samples.

Subjects can contact the investigator if they wish to be informed about results derived from stored antibody samples obtained from their own body.

25 Institutional Review Boards and regulatory authorities

IRB:

Written approval or favourable opinion must be obtained from IRB prior to commencement of the trial.

During the trial, the investigator or Novo Nordisk, as applicable, must promptly report the following to the IRB, in accordance with local requirements: updates to IB, unexpected SAEs where a causal relationship cannot be ruled out, protocol amendments according to local requirements, deviations to the protocol implemented to eliminate immediate hazards to the subjects, new information that may affect adversely the safety of the subjects or the conduct of the trial (including new benefit-risk analysis in case it will have an impact on the planned follow-up of the subjects), annually written summaries of the trial status, and other documents as required by the local IRB.

Protocol amendments must not be implemented before approval or favourable opinion according to local regulations, unless necessary to eliminate immediate hazards to the subjects.

The investigator must maintain an accurate and complete record of all submissions made to the IRB. The records must be filed in the investigator trial master file and copies must be sent to Novo Nordisk.

Regulatory Authorities:

Regulatory authorities will receive the clinical trial application, protocol amendments, reports on SAEs, and the clinical trial report according to national requirements.

26 Indemnity statement

Novo Nordisk carries product liability for its products, and liability as assumed under the special laws, acts and/or guidelines for conducting clinical trials in any country, unless others have shown negligence.

Novo Nordisk assumes no liability in the event of negligence, or any other liability of the sites or investigators conducting the trial, or by persons for whom the said site or investigator are responsible.

Novo Nordisk accepts liability in accordance with the compensation scheme specified in ‘The guideline on compensation for harmful effects resulting from participation in clinical trials’ issued by Japanese Pharmaceutical Industry Legal Affairs Association⁵⁵.

Appendix A

Monitoring of Calcitonin

This ~~confidential~~ document is the property of Novo Nordisk. ~~No unpublished information contained herein may be disclosed without prior written approval from Novo Nordisk. Access to this document must be restricted to relevant parties.~~

1 Background

Treatment with GLP-1 receptor agonists has shown to be associated with thyroid C-cell changes in rodents but not in non-human primates. The human relevance of this finding is unknown. However, based on the findings in rodents, monitoring of serum calcitonin (a sensitive biomarker for C-cell activation) is currently being performed in clinical trials with semaglutide.

While there is general agreement on the clinical interpretation of substantially elevated calcitonin levels (greater than 100 ng/L) as likely indicative of C-cell neoplasia, the interpretation of values between upper normal range (5.0 and 8.4 ng/L for women and men, respectively) and 100 ng/L is less clear with regards to indication of disease.

There are several known confounding factors affecting calcitonin levels, e.g.:

- renal dysfunction
- smoking
- autoimmune thyroiditis
- several drug classes (e.g. proton pump inhibitors, beta-blockers, H₂-blockers and glucocorticoids)

Physiology of C-cell activation in various clinical conditions and in different patient populations (i.e. with various co-morbidities) is poorly understood. There may be various clinical conditions not identified so far which mildly or moderately affect calcitonin secretion by C-cells.

2 Calcitonin monitoring

A blood sample will be drawn at pre-specified trial visits for measurement of calcitonin.

In case a subject has a calcitonin value ≥ 10 ng/L the algorithm outlined in [Figure 1](#) and described below should be followed. The algorithm applies for all calcitonin values in the trial.

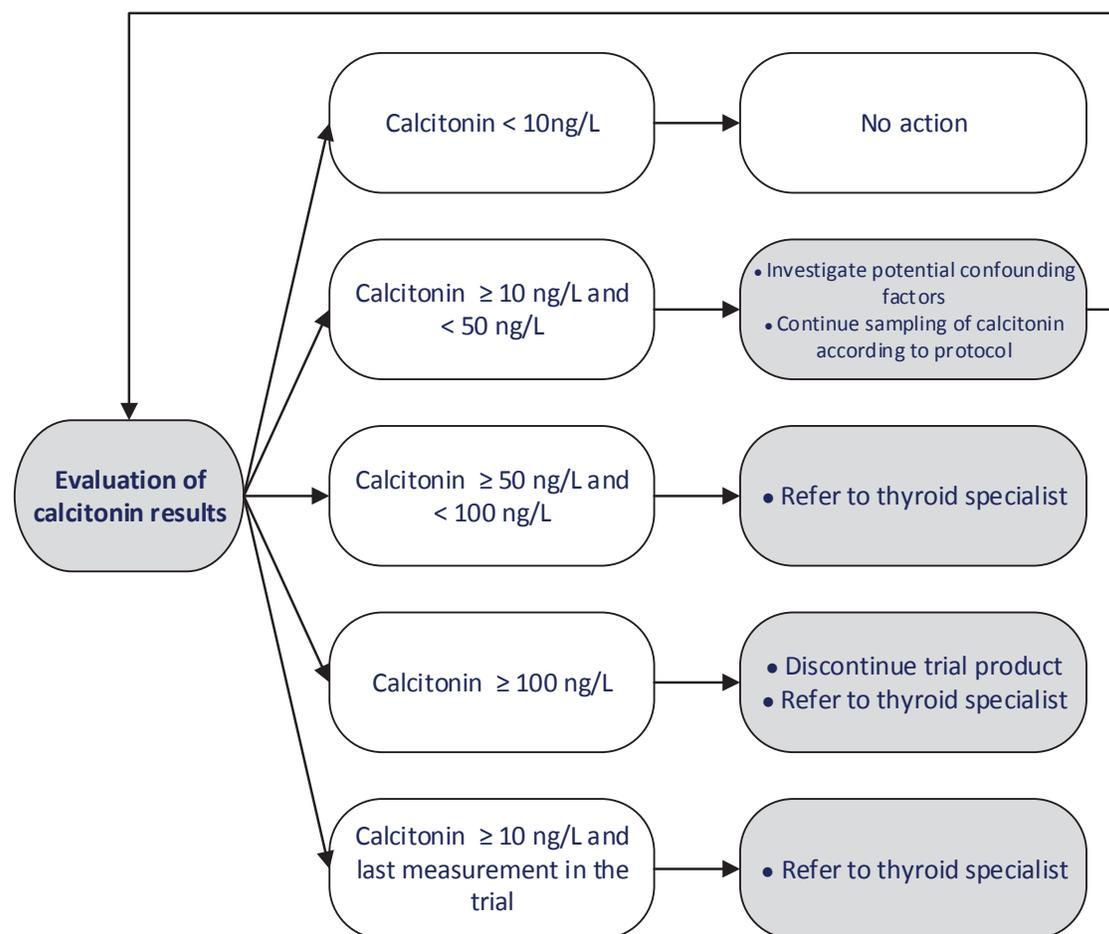

Figure 1 Flow of calcitonin monitoring

2.1 Calcitonin ≥ 100 ng/L

Action: The subject must immediately be referred to a thyroid specialist for further evaluation and the trial product must be discontinued (see protocol Section 6.5 Criteria for premature discontinuation of trial product). The subject should remain in the trial, however, all medications suspected to relate to this condition must be discontinued until diagnosis has been established.

Background: These values were found in 9 (0.15%) of a population of 5817 patients with thyroid nodular disease.¹ All of these patients were diagnosed with medullary thyroid carcinoma (MTC) resulting in a positive predictive value of 100%.

Diagnostic evaluation should include:

- thyroid ultrasound examination
- fine needle aspiration of any nodules > 1 cm
- potentially surgery with neck dissection

In case a subject is diagnosed with MTC, it is common clinical practice to explore the family history of MTC or multiple endocrine neoplasia type 2 (MEN 2) and perform a genetic test for RET proto-oncogene mutation.

2.2 Calcitonin ≥ 50 and < 100 ng/L

Action: The subject should be referred to a thyroid specialist for further evaluation. The subject should remain in the trial and continuation on trial product should be based on the evaluation done by the thyroid specialist.

Background: These values were found in 8 (0.14%) of the population of 5817 patients with thyroid nodular disease¹. Two of these subjects were diagnosed with MTC and two were diagnosed with C-cell hyperplasia, resulting in a positive predictive value of a C-cell anomaly of 50%.

Diagnostic evaluation should include:

- thyroid ultrasound examination
- if available and there are no contraindication, a pentagastrin stimulation test should be done. For subjects with positive pentagastrin stimulation test, surgery should be considered.
- if pentagastrin stimulation test is not available, thyroid ultrasound and fine needle aspiration biopsy may add important clinical information about the need for surgery.

2.3 Calcitonin ≥ 10 and < 50 ng/L

Action: The subject can continue in the trial on trial product. Continue sampling of calcitonin according to the protocol.

If the value is from the last sample taken in the trial, the subject should be referred to a thyroid specialist for further evaluation.

Background: Calcitonin values from 20-50 ng/L were found in up to 1% of subjects of the population of 5817 patients with thyroid nodular disease¹. The predictive value of a C-cell anomaly

for this calcitonin level was 8.3%. However, the likelihood of having a medullary carcinoma >1 cm with calcitonin in this range is extremely low.

For calcitonin values between 10-20 ng/L Costante et al¹ identified 216 (3.7%) patients. One patient out of the 216 had a subsequent basal (unstimulated) calcitonin of 33 ng/L and had C-cell hyperplasia at surgery. Two other studies used a cut-off of calcitonin > 10 ng/L to screen for C-cell disease, but they do not provide sufficient information on patients with basal calcitonin > 10 and < 20 ng/L to allow conclusions.^{2,3}

Appendix B

Adverse events requiring additional data collection

This ~~confidential~~ document is the property of Novo Nordisk. ~~No unpublished information contained herein may be disclosed without prior written approval from Novo Nordisk. Access to this document must be restricted to relevant parties.~~

1 Adverse events requiring additional data collection

For the following adverse events (AEs) additional data collection is required and specific event forms must be completed in the electronic case report form (eCRF) in addition to the AE form:

- Acute coronary syndrome (myocardial infarction or unstable angina pectoris requiring hospitalisation)
- Cerebrovascular event (stroke or transient ischaemic attack)
- Heart failure
- Pancreatitis
- Neoplasm (excluding thyroid neoplasm)
- Thyroid disease (including thyroid neoplasm)
- Renal event
- Hypersensitivity reaction
- Acute gallstone disease
- Medication error (concerning trial products):
 - Administration of wrong drug or use of wrong device.
Note: Use of wrong dispensing unit number (DUN) is not considered a medication error unless it results in administration of wrong drug.
 - Wrong route of administration, such as intramuscular instead of s.c..
 - Administration of an overdose with the intention to cause harm (e.g. suicide attempt), misuse or abuse of trial product.
 - Accidental administration of a higher dose than intended. A higher dose is a dose of at least one tablet more than the intended dose and for pen injection a higher dose than 0.9 mg/day; however the administered dose must deviate from the intended dose to an extent where clinical consequences for the trial subject were likely to happen as judged by the investigator, although they did not necessarily occur.
- Lactic acidosis
- Creatine kinase (CK) > 10 x upper normal limit (UNL)
- Hepatic event defined as:
 - alanine aminotransferase (ALT) or aspartate aminotransferase (AST) > 5 x UNL and total bilirubin \leq 2 x UNL
 - ALT or AST > 3 x UNL and total bilirubin > 2 x UNL*
 - Hepatic event leading to trial product discontinuation

*Please note that in case of a hepatic event defined as ALT or AST > 3 x UNL and total bilirubin > 2 x UNL, where no alternative aetiology exists (Hy's law), this must be reported as an SAE using the important medical event criterion if no other seriousness criteria are applicable.

In case any of these events fulfil the criteria for a serious adverse event (SAE), please report accordingly, see protocol Section 12.1.2.

Some of these events will undergo event adjudication by the event adjudication committee (EAC), see protocol Section 12.7.2 and protocol Table 12-1.

1.1 Acute coronary syndrome

If an event of acute coronary syndrome (ranging from unstable angina pectoris requiring hospitalisation to myocardial infarction) is observed during the trial, the following additional information must be reported if available:

- Duration of symptoms
- Changes in electrocardiogram (ECG)
- Collection of cardiac biomarkers
- Cardiac imaging
- Cardiac stress testing
- Angiography
- Use of thrombolytic drugs
- Revascularisation procedures

1.2 Cerebrovascular event

If a cerebrovascular event (e.g. transient ischaemic attack, stroke) is observed during the trial, the following additional information must be reported if available:

- Type of event (e.g. transient ischaemic attack, stroke)
- Contributing condition
- Neurologic signs and symptoms
- History of neurologic disease
- Imaging supporting the condition
- Treatment given for the condition

1.3 Heart failure

If an event of heart failure is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms of heart failure
- New York Heart Association (NYHA) Class
- Supportive imaging
- Supportive laboratory measurements
- Initiation or intensification of treatment for this condition

1.4 Pancreatitis

For all confirmed events of pancreatitis the following additional information must be reported if available:

- Signs and symptoms of pancreatitis
- Specific laboratory test supporting a diagnosis of pancreatitis
- Imaging performed and consistency with pancreatic disease
- Treatment for and complications of the event
- Relevant risk factors for pancreatic disease
- Family history of pancreatic disease

1.4.1 Assessments in case of suspicion of acute pancreatitis

Most patients with acute pancreatitis experience severe abdominal pain that is located generally in the epigastrium and radiates to the back. The onset of the pain may be swift reaching maximum intensity within 30 min, it is frequently unbearable and characteristically persists for more than 24 hours without relief¹. The pain is often associated with nausea and vomiting. Physical examination usually reveals severe upper abdominal tenderness at times associated with guarding.

In general, both amylase and lipase are elevated during the course of acute pancreatitis. The serum lipase may remain elevated slightly longer than amylase. The level of the serum amylase and/or lipase does not correlate with the severity of acute pancreatitis¹. In general, serum lipase is thought to be more sensitive and specific than serum amylase in the diagnosis of acute pancreatitis.

In case of suspicion of acute pancreatitis, the trial product should promptly be interrupted (no treatment discontinuation call should be made in the interactive web response system (IWRS) before diagnosis of acute pancreatitis is confirmed). Appropriate additional examinations must be performed, including local measurement of amylase and lipase.

The diagnosis of acute pancreatitis requires two of the following three features²:

- abdominal pain **consistent** with acute pancreatitis (acute onset of a persistent, severe, epigastric pain often radiating to the back)
- serum lipase activity (and/or amylase activity) at least three times greater than the upper limit of normal
- **characteristic** findings of acute pancreatitis on imaging.

If acute pancreatitis is ruled out, trial product should be re-initiated.

If acute pancreatitis is confirmed, appropriate treatment and careful monitoring of the subject should be initiated. The subject must be discontinued from trial product (treatment discontinuation call), but should remain in the trial (see protocol Section 6.5 and 8.1.6).

1.5 Neoplasm

All events of neoplasms (excluding thyroid neoplasm, which will be reported under thyroid disease) must be reported during the trial and the following additional information must be reported if available:

- Type of neoplasm
- Symptoms leading to identification of event
- Diagnostic imaging
- Pathological examination results
- Treatment for the event
- Participation in screening programs
- Risk factors associated to the event

1.6 Thyroid disease

If an event of thyroid disease, including any thyroid neoplasms, is observed during the trial, the following additional information must be reported if available:

- History of thyroid disease
- Signs and symptoms leading to investigations of thyroid disease
- Specific laboratory tests describing thyroid function
- Diagnostic imaging performed and any prior imaging supporting the disease history
- Pathologic examinations
- Treatment given for the condition
- Risk factors identified
- Family history of thyroid disease

1.7 Renal event

If a renal event is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms of renal failure
- Specific laboratory tests supporting the diagnosis
- Imaging performed supporting the diagnosis
- Kidney biopsy results
- Risk or confounding factors identified including exposure to nephrotoxic agents

1.8 Hypersensitivity reaction

All events of hypersensitivity reactions must be reported and the following additional information must be reported if available:

- Signs and symptoms associated to the event
- Time of appearance after administration of trial drug

- Relevant immunological tests performed
- Treatment given for the reaction
- Previous history of similar reaction
- Risk or confounding factors identified

1.8.1 Assessments in case of suspicion of hypersensitivity reaction

In case of suspicion of a severe immediate systemic hypersensitivity reaction³ to the trial product, the subject must be discontinued from trial product but should remain in the trial (see protocol Section 6.5 and 8.1.6).

If suspicion of a hypersensitivity reaction occurs, the subjects should be instructed to contact the site staff as soon as possible for further guidance.

To assist in the diagnostic evaluation it is recommended to draw a blood sample for measurement of tryptase (total and/or mature tryptase, local assessment) within 3 hours of onset of the hypersensitivity reaction, and if this is achieved, a tryptase sample should also be drawn at V13A. Furthermore, a blood sample for assessment of anti-semaglutide IgE antibodies should be drawn as soon as possible after the event and at V13A and sent to central laboratory. Tryptase concentrations, if available, should be included in the specific event form when reporting the AE.

In case of suspicion of immune complex disease³, the subject must be discontinued from trial product but should remain in the trial (see protocol Section 6.5 and 8.1.6). It is recommended to draw a blood sample for local assessment of complement levels (C3 and C4) to assist in the diagnostic evaluation. Complement level results should be included in the specific event form when reporting the AE.

1.9 Acute gallstone disease

If an event of acute gallstone disease or clinical suspicion of this is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms of acute gallstone disease
- Specific laboratory tests supporting a diagnosis of gallstone
- Imaging performed and consistency with gallstone disease
- Treatment given for the condition
- Relevant risk factors for acute gallstone disease
- Family history of gallstones

1.10 Medication error

If a medication error is observed during the trial, the following additional information is required and must be reported:

- Trial product(s) involved
- Classification of medication error
 - Wrong drug(s) administered
 - Administration of an overdose
- Whether the subject experienced any hypoglycaemic episode and/or AE(s) as a result of the medication error
- Suspected primary reason for the medication error

For definition of medication error, see protocol Section 12.1.4.

1.11 Lactic acidosis

If an event of lactic acidosis is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms of lactic acidosis
- Specific laboratory tests describing the event
- Possible cause(s) of the event

1.12 Creatine kinase > 10 x UNL

If an event of CK > 10 x UNL is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms associated to the event
- Recent physical activity
- Possible cause(s) of the event

1.12.1 Assessments in case of increased levels of creatine kinase

In case of CK > 10 x UNL, prompt repeat testing (at central laboratory) of CK should be done. Repeat testing (at central laboratory) should be done regularly until CK levels return to normal or baseline state. Additional clinical information should be gathered to seek the possible cause of the observed CK elevation.

1.13 Hepatic event

- ALT or AST > 5 x UNL and total bilirubin \leq 2 x UNL
- ALT or AST > 3 x UNL and total bilirubin > 2 x UNL*
- Hepatic event leading to trial product discontinuation

*Please note that risk of liver injury defined as ALT or AST > 3 x UNL and total bilirubin > 2 x UNL, where no alternative aetiology exists (Hy's law), should also be reported as a SAE (important medical event, according to protocol Section 12.1.2).

If one of the above events is observed during the trial, the following additional information must be reported if available:

- Signs and symptoms associated to the event
- Risk factors
- Relevant laboratory test results
- Diagnostic imaging performed
- Possible cause(s) of the event

1.13.1 Assessments in case of increased levels of aminotransferases

Both events should prompt repeat testing (at central laboratory) including ALT, AST, alkaline phosphatase (ALP) and total bilirubin and discontinuation of trial product should be considered. Thereafter, repeat testing (at central laboratory) of ALT, AST, ALP and total bilirubin should be done regularly until the abnormalities return to normal or baseline state. Additional clinical information such as related symptoms, risk factors and contributing conditions (e.g. viral hepatitis, autoimmune hepatitis, alcoholic hepatitis, hepatobiliary or pancreatic disorders) should be gathered to seek a possible cause of the observed laboratory test abnormalities.

1 Introduction including rationale for the protocol amendment

This protocol amendment introduces:

1. Change in allowance of eye examinations and additional data collection on diabetic retinopathy
2. Investigator's responsibility in ensuring evaluation and management of certain risk factors and complications
3. Clarification of the criteria for completion, withdrawal and lost to follow-up
4. Other minor corrections and clarifications

1.1 Additional eye examinations and additional data collection on diabetic retinopathy

Protocol sections updated: 2, 4.2.2.2, 8.4.1.2, 8.4.4, 12.1.5, 17.2, 17.4.1.2, 18.1.1, 27; Appendix B section 1 and 1.14 (new).

Transient worsening of diabetic retinopathy is a recognised complication in selected patients with diabetes after initiation of intensive antidiabetic treatment^{1,2,3}. Risk factors for these events include long-standing poor glycaemic control and presence of proliferative retinopathy, and initial large improvements in blood glucose may be an additional aggravating factor. In a recently completed cardiovascular outcomes trial with s.c. semaglutide, results indicate an increased risk of events related to diabetic retinopathy in subjects treated with semaglutide compared to placebo⁴. The majority of the related adverse events were moderate in severity and did not lead to premature discontinuation of trial product. Also, to further understand this safety signal, additional information will be collected for all diabetic retinopathy events reported during the trial. Furthermore, information to the investigators and subjects related to diabetic retinopathy has been added to the protocol (see Section 18).

The timepoint of the eye examination taken at end of treatment (EoT; visit 12 or visit 12A) has been moved to ensure the treatment is completed or finished as for other assessments performed at EoT.

¹ Dahl-Jørgensen K, Brinchmann-Hansen O, Hanssen KF, Sandvik L, Aagaes O. Rapid tightening of blood glucose control leads to transient deterioration of retinopathy in insulin dependent diabetes mellitus: the Oslo study. *Br Med J (Clin Res Ed)*. 1985;290(6471):811-5.

² The Diabetes Control and Complications Trial Research Group. Early worsening of diabetic retinopathy in the Diabetes Control and Complications Trial. *Arch Ophthalmol*. 1998;116(7):874-86.

⁴ Marso SP, Bain SC, Consoli A, Eliaschewitz FG, Jódar E, Leiter LA, et al. Semaglutide and Cardiovascular Outcomes in Patients with Type 2 Diabetes. *N Engl J Med*. 2016.

The Eye examination at the EoT must be performed at visit 12 or within 5 weeks thereafter for subjects completing treatment, and at visit 12A or within 5 weeks thereafter and again within 5 weeks prior to visit 12 for subjects who have prematurely discontinued trial product.

1.2 Investigator's responsibility in ensuring evaluation and management of certain risk factors and complications

Updated sections in the protocol: 8.4.2, 18.1.1

[REDACTED], text is added to highlight the investigators responsibility in relation to further evaluation of potential incidental thyroid nodules discovered at the physical examination.

In addition, text is added to highlight the investigator's responsibility in ensuring evaluation and management of cardiovascular risk factors and microvascular complications such as diabetic kidney disease and diabetic retinopathy.

1.3 Clarification of the criteria for completion, withdrawal and lost to follow-up

Updated sections in the protocol: 6.6, 8.1.5, 8.1.6, 8.1.7.1

The criteria for subject completion, -withdrawal and -lost to follow-up respectively are clarified and have been made consistent across sections. Lost to follow-up is considered a subcategory to withdrawal from trial. In addition, it is emphasised that as soon as contact to a subject is lost, efforts must be made to regain contact and the efforts must continue until the subjects last planned visit. Only if contact is not regained at that time point can the subject be considered lost to follow up. Because this trial is not an outcome trial the terminology 'health status' is replaced with "relevant safety information" - the purpose of which is to follow up on any adverse events or pregnancy, and not to determine if a subject completes the trial or not.

1.4 Other minor adjustments, clarifications and correction of typographical errors

Laboratory analysis

Updated sections in the protocol: 8.4.8

The protocol currently specifies that the *in vitro* neutralising antibody assays will be performed by Novo Nordisk, however, it may be decided by Novo Nordisk that the laboratory currently responsible for antibody binding analysis (Celerion) will perform the assay.

Statistical considerations

Updated sections in the protocol: 17.3.2, 17.4.1.1

For the pattern mixture model using multiple imputation, the number of imputations will be increased from 100 to 1000 data sets, to ensure a greater precision of the estimates. In addition, an error in the number of groups used for imputation is corrected.

2 Changes

In this protocol amendment:

- Any new text is written *in italics*.
- Any text deleted from the protocol is written using ~~strike through~~.

2.1 Section 2 Flow chart

Footer	Description
e	<p>Fundus photography/dilated funduscopy performed within 90 days prior to randomisation is acceptable if results are available for evaluation at V2, unless worsening of visual function since last examination.</p> <p>Fundus photography/dilated funduscopy at V12 is allowed to be performed between V11 and V12 (preferably as close to V12 as possible).</p> <p><i>Fundus photography or dilated funduscopy must be performed again:</i></p> <ul style="list-style-type: none">● <i>at V12 or within 5 weeks thereafter for subjects completing treatment</i>● <i>at V12A or within 5 weeks thereafter, and again within 5 weeks prior to V12, for subjects who have prematurely discontinued trial product</i>

2.2 Section 4.2.2.2 Supportive secondary endpoints

Supportive secondary safety endpoints

...

Change from baseline to week 52 in:

- ~~Fundus photography/dilated funduscopy~~ *Eye examination category*

2.3 Section 6.6 Withdrawal from trial

The subject may withdraw consent at will at any time. The subject's request to withdraw from the trial must always be respected. ~~Only subjects who withdraw consent should be considered as~~

~~withdrawn from trial.~~ *A subject who does not complete the trial is also considered withdrawn from the trial. Hence a subject is considered withdrawn if the following applies:*

- *Subject withdrew consent*
- *Subject is lost to follow up (only to be used if there is no contact with the subject by the time of the subject's last scheduled visit, see sections 8.1.5 – 8.1.7.1)*
- *Other (subject deceased or closure of trial site)*

2.4 Section 8.1.5 End-of-treatment (visit 12) and Follow-up (visit 13)

Subjects, who stay on trial product throughout the trial, must attend the End-of-treatment visit (visit 12) 52 weeks after randomisation (± 3 days visit window) and the Follow-up visit (visit 13) 5 weeks after the last date on trial product (+3 days visit window). A completion call must be performed in the IWRS after completion of visit 12 (see Section 10).

At visit 12 the subject should be reminded about the importance of attending the follow-up visit (visit 13). If the subject, nonetheless, does not attend visit 13, the site should make efforts to obtain contact with the subject within the visit window.

A trial completer is defined as a subject who attends, or is in contact with the site, at the subject's last scheduled visit. For subjects who complete treatment, the last scheduled visit is visit 13. (For subjects who discontinue trial product, see Section 8.1.6)

~~In case the subject cannot be reached (by clinic visit or phone contact) at the scheduled visit 13, the site should consult the contacts provided by the subject (e.g. close relatives), relevant physicians and medical records to collect health status. If no health status can be collected, the subject should be considered lost to follow-up and this should be specified in the end-of-trial form.~~

2.5 Section 8.1.6 Premature discontinuation of trial product and follow-up (visits 12A and 13A)

...

Subjects should continue with the originally scheduled site contacts after visit 13A and up to and including visit 12. If necessary, in order to retain the subject in the trial, site visits can be replaced by phone contacts after visit 13A. However, as a minimum, these subjects should be asked to attend the scheduled visit 8 at week 26 and end-of-treatment (visit 12) at week 52 as these visits should be performed for all subjects, if at all possible (except subjects who withdraw ~~informed~~ consent, see Section 8.1.7).

~~Subjects, who only agree to attend or provide health status at the planned visit 12, should not be considered withdrawn from the trial. In case the subject cannot be reached (by clinic visit or phone contact) at the scheduled visit 12, the site should consult the contacts provided by the subject (e.g. close relatives), relevant physicians and medical records to collect health status. If no health status can be collected, the subject should be considered lost to follow up and this should be specified in the end of trial form.~~

A subject who prematurely discontinued trial product is still considered a trial completer if the subject attends or is in contact with the site, at the subject's last scheduled visit. For subjects who prematurely discontinue trial product, the last scheduled visit is visit 12 (or visit 13A if it is scheduled after visit 12). The site should in due time prepare for establishing contact with the subject within the visit window of the scheduled visit 8 and visit 12, respectively if the subject has agreed to attend these visits.

In summary, subjects should stay in the trial irrespective of lack of adherence to randomised treatment, lack of adherence to visit schedule, missing assessments or trial product discontinuation for any reason. Only subjects who decline any further contact with the site in relation to the trial should be considered as *having withdrawn consent from the trial* (for withdrawal procedures, see Section [8.1.7](#)).

2.6 Section 8.1.7.1 Lost to follow-up

In case contact to the subject is lost during the trial, the site should immediately undertake efforts to re-establish contact. If the subject cannot be reached (by clinic visit or phone contact) and the subject has consented to it, the site should consult the contacts provided by the subject (e.g. close relatives), relevant physicians and medical records in an attempt to regain contact with the subject or to obtain relevant safety information from other sources. Efforts to regain contact should continue until the end of the subject's last scheduled visit: visit 13 for subjects who have completed treatment, whereas for subjects who have discontinued trial product prematurely the last visit is visit 12 (or visit 13A if it is scheduled after visit 12). Only if contact with the subject is not regained by the end of the visit window of the last scheduled visit can the subject be considered lost to follow up (see Section [6.6](#)).

2.7 Section 8.4.1.2 Adverse events requiring additional data collection

For the following AEs additional data collection is required and specific event forms must be completed in the eCRF in addition to the AE form:

- Acute coronary syndrome (MI or unstable angina pectoris requiring hospitalisation)
- Cerebrovascular event (stroke or transient ischaemic attack[TIA])

- Heart failure
- Pancreatitis
- Neoplasm (excluding thyroid neoplasm)
- Thyroid disease (including thyroid neoplasm)
- Renal event
- Hypersensitivity reaction
- Acute gallstone disease
- Medication error
- Lactic acidosis
- Creatine kinase (CK) > 10x UNL
- Hepatic event defined as:
 - ALT or aspartate aminotransferase (AST) > 5x UNL and total bilirubin \leq 2x UNL
 - ALT or AST > 3x UNL and total bilirubin > 2x UNL*
 - Hepatic event leading to trial product discontinuation.
- *Diabetic retinopathy and related complications*

*Please note that in case of a hepatic event defined as ALT or AST >3 x UNL and total bilirubin >2 x UNL, where no alternative aetiology exists (Hy's law), this must be reported as an SAE using the important medical event criterion if no other seriousness criteria are applicable.

2.8 Section 8.4.2 Physical examination

A physical examination will be performed by the investigator according to local procedure (see Sections 2 and 8.1.8). A physical examination must include:

- General appearance
- Head, ears, eyes, nose, throat, neck
- Thyroid gland*
- Respiratory system
- Cardiovascular system
- Gastrointestinal system including mouth
- Musculoskeletal system
- Central and peripheral nervous system
- Skin
- Lymph node palpation

**Please note that the diagnostic evaluation of thyroid nodules should be in accordance with the American Thyroid Association Management Guidelines or any updates hereof³⁹, and adapted to local treatment guidelines if applicable.*

2.9 Section 8.4.4 Eye examination

Fundus photography or dilated funduscopy will be performed as per flow chart (see Section 2) by the investigator or according to local practise. *Fundoscopy requires pharmacological dilation of both pupils.* Results of the fundus photography or dilated funduscopy will be interpreted by the investigator (see Section 8.1.8).

2.10 Section 8.4.8 Anti-semaglutide antibodies

...

Furthermore, samples drawn at randomisation may be used for calculations of the neutralising effect in the in vitro neutralising antibody assays. The in vitro neutralising assays will be performed by Novo Nordisk or the special laboratory responsible for binding antibody analysis.

2.11 Section 12.1.5 Adverse events requiring additional data collection

Table 12-1 Adverse events requiring completion of specific event forms and/or are subject to event adjudication

[Note: In this document only the additional event is shown, all other events are unchanged]

Event	Specific event form	Event adjudication
<i>Diabetic retinopathy and related complications</i>	<i>Yes</i>	<i>No</i>

2.12 Section 17.2 Definition of analysis sets

Definition of the observation periods

...

On-treatment: This observation period represents the time period where subjects are considered treated with trial product. The observation period is a subset of the in-trial observation period. It starts at the date of first dose of trial product. Two slightly different end dates will be needed to cover all assessments appropriately. For adjudicated events, ECGs, *eye examination category*, anti-semaglutide antibodies and AEs including hypoglycaemic episodes, the observation period ends at the first date of any of the following:

- the follow-up visit (V13)
- the follow-up prematurely discontinuation visit (V13A)
- the last date on trial product + 38 days

- the end-date for the in-trial observation period

2.13 Section 17.3.2 Analysis for the secondary estimand

...

Missing values for each group will be imputed as follows:

- An analysis of covariance (ANCOVA) with stratification factor as a categorical fixed effect and baseline HbA_{1c} measurement as a covariate will be fitted to observed values of the change from baseline in HbA_{1c} at week 26.
- The estimated parameters for location and dispersion will be used to impute ~~100~~ 1000 values for each subject with missing week 26 data based on stratification factor and baseline HbA_{1c}. Thus, ~~100~~ 1000 complete data sets will be generated including observed and imputed values.

Analysis used for testing superiority versus placebo at week 26:

For each of the ~~100~~ 1000 (now complete) imputed data sets the change from baseline to week 26 in HbA_{1c} will be analysed using an analysis of covariance (ANCOVA) with treatment and stratification factor as categorical fixed effects and baseline HbA_{1c} as covariate. The results obtained from analysing the datasets will be combined using Rubin's rule^{47/48} to draw inference.

2.14 Section 17.4.1.1 Efficacy endpoints

For evaluation of the secondary estimand the analysis will be performed separately for week 26 and 52. For the analysis at week 52, the imputation of missing data will be further differentiated by whether subjects have discontinued trial product or initiated rescue medication prior to week 26 or at ~~or~~/after week 26. This will result in imputation of missing data within ~~20~~ 15 groups of subjects instead of the 10 groups as described for the week 26 evaluation in Section 17.3.2. If less than 5 subjects have available data in one of the ~~20~~ 15 groups, the imputation will be made within the 10 groups specified for the primary evaluation. The frequency of missing data is expected to be slightly larger at week 52 compared to week 26. The rate of missing data is expected to decline over time.

Binary efficacy endpoints

...

To account for missing data, the analysis will be made using a sequential multiple imputation approach as described below:

- Multiple imputed data sets (~~100~~ 1000) will be created in which missing values for the underlying continuous assessments are imputed by treatment group and treatment

adherence/rescue status assuming MAR and as described in section 17.3.2 for the secondary estimand and by treatment group assuming MAR and as described in section 17.3.1 for the primary estimand.

- The binary endpoint will be created for each of the ~~100~~ 1000 complete data sets
- Each of the created complete data set will be analysed with the logistic model and inference will be drawn using Rubin's rule^{47/48}.

2.15 Section 17.4.1.2 Safety endpoints

Other safety endpoints

...

Change from baseline to week 52 in:

- ~~Fundus photography/dilated funduscopy~~ Eye examination category

2.16 Section 18.1.1 Risks and precautions with oral semaglutide

Other safety considerations

Diabetic retinopathy *complications*

A transient worsening of diabetic retinopathy is a recognised complication in selected patients with diabetes after initiation of intensive antidiabetic treatment^{49-50, 51, 52}. Risk factors for these events include long-standing poor glycaemic control and presence of proliferative retinopathy, and initial large improvements in blood glucose may be an additional aggravating factor. Several studies have, however, documented long-term beneficial effects of intensive glycaemic treatment in reducing retinopathy progression^{4, 52/53} even in intensively treated patients who experienced early worsening^{50/51}. In a cardiovascular outcomes trial with s.c. semaglutide, results indicate an increased risk of events related to diabetic retinopathy in subjects treated with semaglutide compared to placebo⁵⁴. As a precaution in this trial, all subjects are required to have a fundus photography or dilated funduscopy performed before enrolment into the trial; moreover, subjects with proliferative retinopathy or maculopathy requiring acute treatment will be excluded. *As part of good diabetes management the investigator is encouraged to ensure adequate monitoring and treatment of diabetic retinopathy in subjects enrolled into the trial*⁵⁵

...

General precautions

...

It is the responsibility of the investigator to ensure the best possible care *of the subject*. This includes adequate glycaemic control, appropriate risk factor modification such as optimal treatment of hypertension, dyslipidaemia and other cardiovascular risk factors, as well as regular monitoring and treatment of diabetic kidney disease and diabetic retinopathy (Diabetes Care 2016 Standards of Medical Care in Diabetes)⁵³⁵⁵.

2.18 Reference numbers

Will change throughout the protocol when new reference numbers are introduced.

2.19 Appendix B, section 1 Adverse events requiring additional data collection

For the following adverse events (AEs) additional data collection is required and specific event forms must be completed in the electronic case report form (eCRF) in addition to the AE form:

- Acute coronary syndrome (myocardial infarction or unstable angina pectoris requiring hospitalisation)
- Cerebrovascular event (stroke or transient ischaemic attack)
- Heart failure
- Pancreatitis
- Neoplasm (excluding thyroid neoplasm)
- Thyroid disease (including thyroid neoplasm)
- Renal event
- Hypersensitivity reaction
- Acute gallstone disease

- Medication error (concerning trial products):
 - Administration of wrong drug or use of wrong device.
Note: Use of wrong dispensing unit number (DUN) is not considered a medication error unless it results in administration of wrong drug.
 - Wrong route of administration, such as intramuscular instead of s.c..
 - Administration of an overdose with the intention to cause harm (e.g. suicide attempt), misuse or abuse of trial product.
 - Accidental administration of a higher dose than intended. A higher dose is a dose of at least one tablet more than the intended dose and for pen injection a higher dose than 0.9 mg/day; however the administered dose must deviate from the intended dose to an extent where clinical consequences for the trial subject were likely to happen as judged by the investigator, although they did not necessarily occur.
- Lactic acidosis
- Creatine kinase (CK) > 10 x upper normal limit (UNL)
- Hepatic event defined as:
 - alanine aminotransferase (ALT) or aspartate aminotransferase (AST) > 5 x UNL and total bilirubin \leq 2 x UNL
 - ALT or AST >3 x UNL and total bilirubin > 2 x UNL*
 - Hepatic event leading to trial product discontinuation
- *Diabetic retinopathy and related complications*

2.20 Appendix B, Section 1.14 Diabetic retinopathy and related complications

If an event of diabetic retinopathy (or related complications) is observed during the trial the following additional information must be reported, if available:

- *Signs and symptoms associated with the event*
- *Results of the eye examination*
- *Treatment for and complications of the event*
- *Contributing conditions*
