**PRÉCIS**

**VRC 608:** A Phase I, Open-Label, Dose-Escalation Study of the Safety and Pharmacokinetics of a Human Monoclonal Antibody, VRC-EBOMAB092-00-AB (MAb114), Administered Intravenously to Healthy Adults

**Study**

**Design:** VRC 608 is the first-in-human Phase I study to examine safety, tolerability and pharmacokinetics of the monoclonal antibody (MAb), VRC-EBOMAB092-00-AB (MAb114). MAb114 will be administered as a single dose. The hypotheses are: 1) MAb114 administration to healthy adults will be safe by the intravenous (IV) route; and 2) MAb114 will be detectable in human sera with a definable half-life. The primary objectives are to evaluate the safety and tolerability of MAb114 in healthy adults. Secondary objectives will evaluate the pharmacokinetics of MAb114 and the potential to detect an anti-drug antibody response to MAb114.

**Product**

**Description:** MAb114 is a human IgG1 MAb targeted to the *Zaire ebolavirus* (EBOV) glycoprotein (GP). It was developed by the VRC/NIAID/NIH and manufactured at Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) under current Good Manufacturing Practice (cGMP) regulations. MAb114 is supplied as a lyophilized product in a glass vial at 400 mg per vial with target overfill to 425 mg per vial.

**Subjects:** Up to 30 healthy adults, 18-60 years of age.

**Study Plan:** This is an open-label, dose-escalation study of MAb114 administered by IV infusion at dosages of 5, 25 and 50 mg/kg (Groups 1-3). Enrollment will begin with the lowest dose group. Following the first product administration in each group, the study team will wait at least 3 days before administering MAb114 to a second subject within the same group. Dose-escalation evaluations will occur to ensure the safety data support proceeding to the higher doses. Solicited reactogenicity following product administration will be evaluated using a 3-day diary. Assessment of safety will include clinical observation and monitoring of serum hematological and chemical parameters at defined timepoints throughout the study.

VRC 608 Study Schema		
Group	Subjects	Dose and Route (Day 0)
1	3	5 mg/kg IV
2	5	25 mg/kg IV
3	10	50 mg/kg IV
Total*	18	*A minimum of 18 subjects will be enrolled. Enrollment up to a total of 30 subjects is permitted if additional subjects are necessary for safety or pharmacokinetic (PK) evaluations.

**Study Duration:** Subjects will be followed for 24 weeks after the study product administration.

## 1. INTRODUCTION

Ebolavirus is a large, negative-strand ribonucleic acid (RNA) virus composed of 7 genes encoding viral proteins, including a single glycoprotein (GP) [1-3]. Ebolavirus is one of three genera in the Filoviridae family, which along with Marburgvirus, is known to induce viral hemorrhagic fever. In 2013, the International Committee on the Taxonomy of Viruses (ICTV) Filoviridae Study Group and other experts published an updated taxonomy for filoviruses. Five distinct species in the genus Ebolavirus have been implicated as the etiological agent of Ebolavirus disease (EVD), formerly known as Ebola hemorrhagic fever (EHF) in humans: Bundibugyo (BDBV), Reston (RESTV), Sudan (SUDV), Tai Forest (TAFV), and Zaire (EBOV) [4]. The BDBV, EBOV, and SUDV strains have been associated with large EVD outbreaks in Africa, with reported case fatality rates of up to 90% [5].

Ebolavirus was first described in 1976 near the Ebola River in the Democratic Republic of Congo (DRC). Since 1976, there have been multiple Ebola outbreaks with cases detected in many countries [6]. The largest EVD outbreak occurred in 2014 in West Africa and resulted in over 28,000 reported EVD cases and over 11,000 deaths [7]. EVD cases in persons who traveled from endemic areas were also reported in Italy, Spain, the United States (US) and the United Kingdom (UK) [6]. While the World Health Organization (WHO) declared an end to the EVD public health emergency in March 2016, small outbreaks continue to occur [7]. Given the frequency of international travel, EVD remains a global threat to public health.

Transmission of Ebolavirus to humans is not yet fully understood, but is likely due to incidental exposure to infected animals [8-10], through direct contact with blood, secretions, organs or other bodily fluids of infected people (alive and dead); and through indirect contact with environments contaminated by such fluids [5]. People are infectious for as long as their blood and secretions contain the virus. Men who have recovered from the disease can still transmit the virus through their semen for up to 7 weeks after recovery from illness [5], [11, 12].

EVD has an incubation period of 2 to 21 days (7 days on average, depending on the strain) followed by a rapid onset of non-specific symptoms such as fever, extreme fatigue, gastrointestinal complaints, abdominal pain, anorexia, headache, myalgias and/or arthralgias. These initial symptoms, which last for about 2 to 7 days, are followed by more severe symptoms related to hemorrhagic fever (e.g., hemorrhagic rash, epistaxis, hematuria, hemoptysis, hematemesis, melena, conjunctival hemorrhage, tachypnea, confusion, somnolence, hearing loss, and in some cases, both internal and external bleeding) and accompanied with low white blood cell (WBC) and platelet counts and elevated liver enzymes [5]. These symptoms generally last for about 7 to 14 days. Death can occur 6 to 16 days after the onset of symptoms, manifested by vomiting and diarrhea resulting in dehydration, shock and then multi-organ failure [8, 13].

Immunoglobulin M (IgM) antibodies to the virus appear 2 to 9 days after infection, followed by immunoglobulin G (IgG) antibodies at approximately 17 to 25 days after infection; the latter coinciding with the recovery phase [14]. In survivors of EVD, both humoral and cellular immunity are detected; however, their relative contribution to protection is unknown [14, 15].

Currently, no Food and Drug Administration (FDA)-approved therapies or licensed vaccines exist for any member of Filoviridae family of viruses.

## 1.1 Study Rationale

### 1.1.1 Passive Immunization with an Ebola-specific Antibody: MAb114

The Vaccine Research Center (VRC), National Institute of Allergy and Infectious Diseases (NIAID), National Institutes of Health (NIH) has developed an EBOV neutralizing MAb, VRC-EBOMAB092-00-AB (MAb114), targeted against the Ebolavirus Zaire GP. This MAb was identified from a subject infected with Ebolavirus during the 1995 outbreak in Kikwit, Democratic Republic of Congo, and who maintained circulating antibody for more than 10 years after infection [16]. MAb114 was selected following isolation and screening of a panel of memory B-cells based on its binding to the Ebolavirus GP and *in vitro* neutralization potential [16], [17]. Rhesus macaques passively immunized with MAb114 up to five days post-challenge with a lethal dose of EBOV were protected from EVD, suggesting its potential therapeutic potential in humans with EVD [16]. In earlier reports, cocktails of different MAbs have been tested in non-human primates (NHPs) and in a small number of humans; however, none have been proven to effectively treat EVD [18, 19].

The 2014 outbreak underscored the importance of a therapeutic strategy for populations when widespread vaccination coverage is not available or feasible such as when there are limited public health resources. Based on its *in vitro* activity and previous experience with other MAbs against EVD, the rationale for development of MAb114 is to provide a simplified therapeutic product and/or dosing regimen for EVD, identify mechanism(s) of EVD protection and explore development for potential stockpiling [20].

This Phase I study, VRC 608, is primarily directed at evaluation of the safety and pharmacokinetics of MAb114, which may provide therapeutic benefit with a single infusion in cases of EBOV exposure/infection.

### 1.1.2 Rationale for Dose and Administration Route Selection

Preclinical data in the NHP animal model informed the doses of MAb114 (5-50 mg/kg) that will be evaluated. In the GLP toxicity study, MAb114 doses ranging from 50 to 500 mg/kg/ week were well-tolerated, with MAb114 demonstrating linear kinetics and a 7-15-day half-life. Preliminary evidence in a NHP model of EVD showed a 50 mg/kg dose of MAb114 was protective to NHPs when administered up to five days post-EBOV challenge [16]. Moreover, a 25 mg/kg dose is important to explore because PK data on a 25mg/kg dose is valuable should future, planned dose-down studies in an NHP dose-down lethal challenge establish protection.

In an epidemic situation, application of effective protection measures against EBOV infection is urgent for exposed individuals. MAb114 will be administered by IV infusion to accelerate delivery as passive immunization studies with other MAbs developed by the VRC has shown antibody concentration peaks within hours after IV administration [21].

Refer to the Investigator's Brochure (IB) for more information on these proof-of-concept preclinical studies.

## 1.2 MAb114 Specific Research Laboratory Assessments

Research assays designed to characterize the investigational product rather than assess the health of the subjects are described below.

Research laboratory assessments in this Phase I study will include:

- MAb114 PK determinations as measured by enzyme-linked immunosorbent assay (ELISA),
- Detection of anti-drug antibody (ADA) to MAb114,
- Measurement of EBOV envelope GP-specific binding antibody by ELISA, and
- Ex vivo neutralization potential of MAb114 post-infusion as an exploratory evaluation.

De-identified stored samples may also be used later to further evaluate pharmacokinetics and to elucidate genetic factors associated with MAb114 pharmacokinetics.

Testing will be performed at the Vaccine Immunology Testing Laboratory (VITL) (known formerly as the NIAID Vaccine Immune T-Cell and Antibody Laboratory or NVITAL), in research laboratories at the VRC, Laboratory of Immunology, Biodefense Research Section, NIAID, NIH or by other approved collaborators.

### 1.3 Preclinical Toxicology Study of VRC-EBOMAB092-00-AB (MAb114)

A 4-week repeat dose intravenous toxicity study of MAb114 in male and female rhesus monkeys was performed by CiToxLAB North America (Québec, Canada) in accordance with Good Laboratory Practice (GLP) regulations. Treatment with IV-administered MAb114 at doses of 50 mg/kg once weekly, 50 mg/kg three times per week, and 500 mg/kg once weekly resulted in detectable concentrations of MAb114 at the end of the 8-week recovery period. There were no MAb114-related mortalities, clinical signs, or changes in body weight parameters following either one or three times weekly slow bolus IV infusions of MAb114 at 50 mg/kg (50 and 150 mg/kg/week, respectively) or weekly IV infusion of MAb114 at 0 or 500 mg/kg (500 mg/kg/week).

There were no MAb114-related effects on safety pharmacology parameters and no MAb114-related findings in eye exams. Hematology, coagulation and urinalysis parameters were not impacted by the MAb114 treatment. Clinical chemistry evaluations revealed non-adverse MAb114-related increases in serum globulins and total proteins with a secondary reduction in A/G ratio in individual animals, mainly in monkeys administered 500 mg/kg/week at Day 25. These findings were considered secondary to the administration of a high dose of a human immunoglobulin and were generally reversible upon cessation of dosing.

Details on preclinical studies conducted with MAb114 can be found in the IB.

### 1.4 *In Vitro* Safety Studies

The list of *in vitro* preclinical safety studies performed to assess potential off target binding of MAb114 are summarized in **Table 1**. Refer to the IB for more information about these studies.

**Table 1: *In Vitro* Preclinical Safety Studies**

Study Purpose	Study Outcome
Assessment of anti-phospholipid reactivity	MAB114 does not react to phospholipids.
Assessment of binding to a human epithelial cell line (HEp-2) by Immunohistochemistry	MAB114 does not bind to HEp-2 cells.
Assessment of potential “off target” binding in a GLP tissue cross-reactivity study with normal adult human tissues	To determine the potential cross reactivity of MAB114 binding, varying concentrations of MAB114 (1 and 10 mcg/mL) were applied to cryosections from a full panel of normal human adult tissues. Specific MAB114 staining was not observed in any tissue evaluated. The cytoplasmic or extracellular staining observed in multiple tissue elements was also noted on control slides and thus attributed to the secondary antibody. Overall, <i>in vitro</i> tissue cross-reactivity evaluations failed to identify potential tissue sites or organ systems for MAB114 binding in humans.

**1.5 Non-Human Primate (NHP) Studies of VRC-EBOMAB092-00-AB (MAb114)**

Non-GLP studies of MAB114 have been completed in NHPs to assess for preclinical evidence of potential efficacy for treatment of EVD. **Table 2** summarizes the studies performed and supports the plan to evaluate up to 50 mg/kg dose administered IV as a dose range of potential interest for a therapeutic indication.

**Table 2: Preclinical proof-of-concept studies performed with MAB114 in NHP**

Study Purpose	Study Outcome
Demonstration of protection with 3 doses of MAB114 administered at 3 different timepoints 24 hours apart starting one day after challenge with lethal dose of EBOV in female rhesus macaques	100% (3/3) of the female rhesus macaques infected with EBOV were protected from mortality when dosed with a 50 mg/kg IV dose of MAB114 administered 24, 48 and 72 hours post-challenge with EBOV. Control animal succumbed. [16]
Demonstration of protection with 3 doses of MAB114 administered at 3 different timepoints 24 hours apart starting five days after challenge with lethal dose of EBOV in female rhesus macaques	100% (3/3) of the female rhesus macaques infected with EBOV were protected from mortality when dosed with a 50 mg/kg IV dose of MAB114 administered 120, 144 and 168 hours post-challenge with EBOV. Control animal succumbed. [16]
Demonstration of protection with a single dose of MAB114 administered five days after challenge with lethal dose of EBOV in female rhesus macaques.	100% protection (3/3) from mortality demonstrated for a single 50 mg/kg dose administered IV five days post-challenge with EBOV. Control animal succumbed [data not published].
Demonstration of protection with a single dose of MAB114 administered five days after challenge with lethal dose of EBOV in female rhesus macaques.	100% protection (3/3) from challenge demonstrated for a single 30 mg/kg dose administered IV five days post-challenge with EBOV. Control animal succumbed [data not published].

## 1.6 Previous Human Experience

### 1.6.1 Human Experience with MAb114

As of 7/24/2018, 13 subjects have been enrolled and received one dose of MAb114 administered IV: 3 subjects received 5 mg/kg, 5 subjects received 25 mg/kg, and 5 subjects received 50 mg/kg. Overall, 13 product administrations have been completed.

There have been no serious adverse events (SAEs). Overall, 2 of 13 subjects (15.4%) have had one or more unsolicited adverse events (AEs) reported, with maximum severity being Grade 1 for 1 subject and Grade 2 for 1 subject, and all assessed as not related to the study product.

Product administrations have been well tolerated. No systemic or local reactogenicity symptoms were reported during the 30-minute MAb114 infusions.

Overall, 13 subjects completed diary cards. There were no reported or observed solicited local reactions in the 7 days after product administration. Regarding solicited systemic events, 3 of 11 subjects (23.1%) reported one or more mild systemic signs or symptoms in the 3 days after IV product administration. This included mild symptoms of malaise (n=2), myalgia (n=2), headache (n=3), chills (n=2), nausea (n=2), and joint pain (n=2).

### 1.6.2 Human Experience with Other Ebola-Specific Antibodies

Development and limited testing of other therapeutic MAbs indicated that these MAbs may have an acceptable safety profile in EVD-infected humans [18]. The triple monoclonal antibody product, ZMapp™, was administered to infected individuals during the recent 2014 outbreak demonstrating that MAbs have been tested in the treatment of EVD. Although efficacy was not demonstrated, the product was shown to be safe [19].

Recently data has been published on a new, co-formulated cocktail of three MAbs, REGN3470-3471-3479, targeting three non-overlapping epitopes on Ebolavirus glycoprotein. The product was developed by the Regeneron Pharmaceuticals, Tarrytown, NY, and was shown to be safe and well tolerated in a Phase 1 study in healthy adults [22].

## 2. STUDY PRODUCT

The study product, VRC-EBOMAB092-00-AB (MAb114) was developed by the VRC, NIAID, NIH (Bethesda, MD) and manufactured under cGMP by Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) operating under contract by MedImmune LLC (Gaithersburg, MD). MAb114 is a human IgG1 MAb targeted against the glycan cap and core domains in the GP1 subunit of *Zaire* EBOV GP [16].

The study product was produced using recombinant DNA technology. Following identification of the MAb114 memory B cell clone, heavy and light chain sequences were obtained by PCR amplification and DNA sequencing. Heavy and light chain sequences were cloned into an expression vector at Celca GmbH (Laupheim, Germany). This expression vector was used to generate a stably transfected Chinese Hamster Ovary (CHO) DG44 cell line for use in cGMP manufacture.

The bulk lot of the drug substance was manufactured at Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) by purifying antibody produced from the stably transfected DG44 cell line. The drug substance was formulated, sterilized by membrane filtration, filled into glass vials, and lyophilized. The lyophilized product contains 400 mg of drug substance per vial with

target overfill to 425 mg per vial. Filled vials were transferred to the Vaccine Clinical Materials Program (VCMP), Leidos Biomedical Research, Inc. (Frederick, MD) for labeling. Vials are reconstituted prior to use. Reconstitution will involve addition of sterile water for injection (SWFI). The reconstituted product will nominally contain a 50 mg/mL concentration of MAb114 in 20 mM Histidine/Histidine HCl, 240 mM Sucrose, 0.02% Polysorbate 80, at pH 6.0. Vials are intended for single-use only and thus do not contain a preservative.

Details on MAb114 composition and manufacturing are provided in the IB. Quality Assurance (QA) lot release testing by the manufacturer and ongoing stability programs verify conformance to product specifications throughout trial conduct.

### 3. STUDY OBJECTIVES

#### 3.1 Primary Objectives

- To evaluate the safety and tolerability of MAb114 administered as a single dose at 5 mg/kg IV to healthy adults.
- To evaluate the safety and tolerability of MAb114 administered as a single dose at 25 mg/kg IV to healthy adults.
- To evaluate the safety and tolerability of MAb114 administered as a single dose at 50 mg/kg IV to healthy adults.

#### 3.2 Secondary Objectives

- To evaluate the pharmacokinetics of MAb114 at each dose level at representative timepoints throughout the study.
- To determine whether anti-drug antibody to MAb114 can be detected in recipients of MAb114.

#### 3.3 Exploratory Objectives

- To evaluate for evidence of GP-binding activity of MAb114 in samples collected at representative timepoints throughout the study.
- To evaluate for evidence of functional neutralization activity of MAb114 in samples collected at representative timepoints throughout the study.
- Genetic factors associated with MAb114 pharmacokinetics may also be evaluated.

### 4. STUDY DESIGN

This is an open-label, dose-escalation study to examine the safety, tolerability, and PK of MAb114 in healthy adults. The primary hypothesis is that MAb114 administration will be safe by the IV route. The secondary hypothesis is that MAb114 will be detectable in human sera with a definable half-life. The study schema is shown in **Table 3**.

**Table 3: VRC 608 Study Schema**

Group	Subjects	Administration Schedule
		Day 0
1	3	5 mg/kg IV
2	5	25 mg/kg IV
3	10	50 mg/kg IV
Total*	18	*A minimum of 18 subjects will be enrolled. Enrollment up to a total of 30 subjects is permitted if additional subjects are necessary for safety or PK evaluations.

Enrollment will begin in the 5 mg/kg IV dose group (Group 1). Following the first product administration for each group, the study team will wait at least 3 days before administering MAb114 to additional subjects within that group. Dose escalation and subject enrollment into Groups 2 and 3 may proceed after interim safety reviews for the lower dose group as described in Section 4.3.

Safety review decisions and the status of the enrollment process will be presented to the Protocol Safety Review Team (PSRT) throughout the trial and discussed during the safety review meetings as described in Section 8.8.

Subjects will be expected to be available for follow-up visits during the 24 weeks of study participation. Safety laboratory and PK samples will be collected at specified intervals throughout the study as per the Schedule of Evaluations. Subjects will keep a daily diary of solicited systemic symptoms for 3 days after study product administration.

The study will be conducted by the VRC Clinical Trials Program (CTP) at the Vaccine Evaluation Clinic, NIH Clinical Center (NIH CC).

**4.1 Study Population**

All inclusion and exclusion criteria must be evaluated for eligibility.

**4.1.1 Inclusion Criteria**

*A volunteer must meet all of the following criteria:*

1. Able and willing to complete the informed consent process.
2. Available for clinical follow-up through the last study visit.
3. 18 to 60 years of age.
4. In good general health without clinically significant medical history.
5. Willing to have blood samples collected, stored indefinitely, and used for research purposes.
6. Able to provide proof of identity to the satisfaction of the study clinician completing the enrollment process.
7. Physical examination without clinically significant findings within the 84 days prior to enrollment.
8. Have screening laboratory values within 84 days prior to enrollment that meet the following criteria:
  - WBC 2,500-12,000/mm<sup>3</sup>

- WBC differential either within institutional normal range or accompanied by the Principal Investigator (PI) or designee approval
- Platelets = 125,000 – 400,000/mm<sup>3</sup>
- Hemoglobin within institutional normal range or accompanied by the PI or designee approval
- Creatinine  $\leq 1.1$  x upper limit of normal (ULN)
- ALT  $\leq 1.25$  x ULN
- Negative for human immunodeficiency virus (HIV) infection by a Food and Drug Administration (FDA) approved method of detection
- Negative for Hepatitis B core antibody (HBcAb) and Hepatitis C virus antibody (HCV Ab)

***Criteria applicable to women of childbearing potential:***

9. If a woman is of reproductive potential and sexually active with a male partner, then she agrees to use an effective means of birth control from the time of study enrollment until the last study visit, or to be monogamous with a partner who has had a vasectomy.
10. Negative human chorionic gonadotropin ( $\beta$ -HCG) pregnancy test (urine or serum) on day of enrollment and product administration.

**4.1.2 Exclusion Criteria**

***A volunteer will be excluded from study participation if one or more of the following conditions apply:***

1. Previous receipt of a licensed or investigational monoclonal antibody or Ebola vaccine.
2. Weight >100 kg.
3. Any history of a severe allergic reaction with generalized urticaria, angioedema or anaphylaxis prior to enrollment that has a reasonable risk of recurrence during the study.
4. Hypertension that is not well controlled.
5. Woman who is breast-feeding or planning to become pregnant during study participation.
6. Receipt of any investigational study product within 28 days prior to enrollment.
7. Any other chronic or clinically significant medical condition that in the opinion of the investigator would jeopardize the safety or rights of the volunteer, including but not limited to: diabetes mellitus type I, chronic hepatitis; OR clinically significant forms of: drug or alcohol abuse, asthma, autoimmune disease, psychiatric disorders, heart disease, or cancer.
8. Bleeding disorder diagnosed by a doctor (e.g. factor deficiency, coagulopathy, or platelet disorder requiring special precautions) or significant bruising or bleeding difficulties with IM injections or blood draws.
9. Use of angiotensin-converting enzyme (ACE) inhibitors or other potential nephrotoxins.

## 4.2 Clinical Procedures and Laboratory Assays

Safety evaluations will include laboratory studies, medical history, and physical assessment by clinicians. The study schedule is provided in Appendix III. Total blood volume drawn from each subject will comply with the NIH CC Guidelines available on the NIH intranet at the following link: <http://cc-internal.cc.nih.gov/policies/PDF/M95-9.pdf>.

### 4.2.1 Screening

Screening for this study will be completed through the VRC's screening protocol, VRC 500 (NIH 11-I-0164); no screening evaluations will be performed within this protocol. Volunteers will be recruited through Institutional Review Board (IRB)-approved advertising.

The evaluations and sample collection that will be included in screening are a medical history, physical exam, any laboratory tests needed to confirm eligibility, and pregnancy test for females of reproductive potential. The screening evaluations are outlined in Appendix III. Additional assessments of health may be conducted at screening based on clinical judgment. Only subjects determined to be eligible after screening is completed will be enrolled. Research samples of peripheral blood mononuclear cells (PBMCs), plasma and serum will also be collected. VRC 608 informed consent documents will be reviewed. Counseling related to potential risks of the study product and pregnancy prevention will be performed. An Assessment of Understanding (AoU) will be completed in association with enrollment into VRC 608. Records will be maintained that document the reason(s) why a screened individual was not enrolled.

### 4.2.2 Enrollment, Study Days and Visit Numbers

Clinicians must discuss the target dates and timing of the study product administration and sample collections before completing each enrollment to help ensure that the subjects can comply with the projected schedule. In this study, enrollment is defined as the assignment of a study identification number and study group schedule in the clinical database. Informed consent must be obtained prior to enrollment. Enrollment may occur on the same day as product administration at Visit 02 (Day 0) or in advance of product administration at Visit 01R (Day -28 to Day 0).

Visit 02 (Day 0) is defined as the day of MAb114 administration. Day 0 is preferably conducted within 14 days after enrollment but may occur up to 28 days after enrollment if needed. This period may be increased with PI approval.

For calculating elapsed days following Day 0, each subsequent calendar date is labeled by the next sequential "Study Day" as shown in the Schedule of Evaluations, Appendix III. Since there may be more than one research sampling timepoint of interest per study day, each sample collection timepoint has its own "Visit Number." For this reason, there may be more than one visit number recorded on the same calendar date.

Medical history and Day 0 evaluations prior to the study product administration are the baseline for subsequent safety assessments.

### 4.2.3 Administration of MAb114

All study product administrations will be completed according to the group assignment. For women of childbearing potential, study product administration may not proceed unless a negative pregnancy test has been obtained. Prior to study product administration, temperature, blood

pressure, heart rate (pulse) and weight will be collected, and a targeted physical examination will be conducted.

In all study groups, the subject will be observed for at least 4 hours following completion of product administration. Following the first product administration for each group, the study team will wait at least 3 days before administering MAb114 to additional subjects within that group.

On Day 0, an IV access will be established in an arm vein using aseptic technique. A different site may be used for collection of PK blood samples; however, the same site may be used after flushing the line if another site is not available. MAb114 will be diluted with normal saline and infused over a period of approximately 30 minutes; longer infusion times will be permitted. Infusion should continue until the bag is empty. If the subject experiences side effects during the infusion, the rate of infusion may be slowed or stopped to alleviate the symptoms.

Procedures for MAb114 preparation and administration are described in Section 7.

#### **4.2.4 Solicited Adverse Events and Clinical Follow-up**

Subjects will be asked to record temperature and systemic symptoms daily for 3 days after the study product administration. Subjects will be trained and encouraged to use the electronic database to record reactogenicity but will have the option to use a paper diary card. When the 3-day diary parameters are recorded directly by the subject into the database, the subject's electronic record will be available to clinicians in real time and will be the source for these data. If concerns arise based on the subject's report of symptoms, clinicians may follow up with additional phone calls during the reactogenicity period as needed. The paper diary will be the source document, if used by the subject. When neither a paper nor electronic diary is available from the subject, the clinician will note the source of reactogenicity information recorded in the study database.

For this study, solicited systemic parameters occurring during the 3 days after receipt of study product will include: unusually tired/feeling unwell, muscles aches, headache, chills, nausea and joint pain. Subjects will also record highest measured temperature daily. Subject diaries are reviewed for accuracy and completeness at follow-up visits and reactogenicity is recorded without an attribution assessment. Clinicians will follow and collect resolution information for any reactogenicity symptoms that are not resolved within 3 days.

Local symptoms will be assessed and recorded by the clinicians. Local reactogenicity parameters will include pain/tenderness, swelling, redness, bruising, and pruritus (itchiness) at the product administration site. Clinicians will assess the study product administration site(s) for local reactogenicity on the day of product administration after completion of the administration and during the scheduled follow-up time points as noted in the Schedule of Evaluations (Appendix III).

Events that may require a clinic visit include rash, urticaria, fever of 38.6°C (Grade 2) or higher lasting greater than 24 hours or significant impairment in the activities of daily living (such as those consistent with Grade 2 or higher impairment). Additionally, arthralgia or other clinical concerns may prompt a study visit based on the judgment of a study clinician.

Clinical laboratory assays and clinical evaluations will assess for safety and tolerability at specified intervals post study product administration. Any new or concerning symptoms will be fully assessed to include specialty consultation at the NIH CC as clinically indicated.

#### 4.2.5 Pharmacokinetics

PK samples will be collected as close as reasonably possible to the target timepoints. Because the time of blood collection is critical for PK analysis, the actual time of the phlebotomy will be recorded for all samples. The PK target timepoints are defined in the Schedule of Evaluations (Appendix III).

#### 4.2.6 Schedule of Evaluations

The Schedule of Evaluations (Appendix III) provides details on the study schedule and the permitted visit windows. After enrollment, deviations from the visit windows are discouraged but will be permitted at the discretion of the PI or designee and will be recorded as protocol deviations.

Additional visits and blood draws may be scheduled during the study if needed to assess subject safety or for sample collection in support of immunological testing provided the cumulative blood collection volume complies with NIH CC guidelines. After study completion, subjects may be invited to participate in one of the VRC sample collection protocols (VRC 200 or VRC 900) for follow-up sample collection.

Any evaluation for an adverse event (AE) or possible exacerbation of a pre-existing condition may be scheduled at the study team's discretion as a "protocol-related" evaluation.

#### 4.2.7 Concomitant Medications

Only routine prescription and over the counter medications, and herbal supplements, will be entered in the database at the time of enrollment. Subsequently, concomitant medications associated with an AE that requires expedited reporting or the development of a new chronic condition requiring ongoing medical management will be recorded in the database. Otherwise, concomitant medications taken throughout the study will be recorded in the subject's chart as needed for general medical documentation but will not be recorded in the study database.

### 4.3 Criteria for Dose Escalation

There are two dose escalation reviews in this study. The PSRT (Section 8.8) will conduct an interim safety data review before the dose escalation may occur. The PSRT must assess the data as showing no significant safety concerns before proceeding with enrollment of each subsequent group.

- The first dose escalation review (from 5 mg/kg IV to 25 mg/kg IV) will occur when all 3 subjects who received the 5 mg/kg IV dose have completed Visit 05, the Day 7 safety follow-up visit. The PSRT review will determine whether enrollment into Group 2 may begin.
- The second dose escalation review (from 25 mg/kg IV to 50 mg/kg IV) will occur when all 5 subjects who received the 25 mg/kg IV dose have completed Visit 05, the Day 7 safety follow-up visit. The PSRT review will determine whether enrollment into Group 3 may begin.

If there are discontinuations from the study before there are sufficient data to conduct the dose continuation review for a specific group, then extra subjects may be enrolled into that group to obtain the requisite data on at least 3 (Group 1) or 5 (Group 2) subjects. Additionally, AEs assessed as related to study product at the time of a dose escalation review may warrant enrollment of additional subjects into a dose group to reassess safety before proceeding to a higher dose.

Consultation with the IRB and FDA, if needed, as per study pause criteria (Section 4.5) will occur if indicated by the review. The IRB will be provided with documentation of the safety review process and notification of the dose escalation.

#### 4.4 Criteria for Discontinuing Study Participation

A subject may be discontinued from study participation for the following reasons:

1. Subject decides to discontinue participation;
2. Subject develops a medical condition that is a contraindication to continuing study participation;
3. The IND sponsor or regulatory authority stops the study;
4. The PI (or designee) assesses that it is not in the best interest of the subject to continue participation in the study or that the subject's compliance with the study is not sufficient.

#### 4.5 Criteria for Pausing the Study and Resuming the Study

Administration of the study product and new enrollments will be paused by the PI according to the criteria noted below. In the event of a pause, the IND Sponsor Medical Officer (MO) and the PSRT will be promptly notified. Pause criteria are as follows:

- **One** (or more) subject experiences a **Serious Adverse Event (SAE)** that is assessed as related to study product, or
- **Two** (or more) subjects experience the same **Grade 3 or higher AEs** assessed as related to study product (other than self-limited Grade 3 solicited reactogenicity AEs).

#### **Plan for Review of Pauses and Resuming Rules:**

Study product administration and enrollments would resume only if review of the AEs that caused the pause results in a recommendation to permit further study product administrations and study enrollments. The reviews to make this decision will occur as follows:

- **Pauses for related SAEs:** The IND Sponsor, with participation by the PI, will conduct the review and make the decision to resume, amend or close the study and will notify the FDA and IRB accordingly.
- **Pauses for Grade 3 or higher related AEs:** The IND Sponsor MO, in consultation with the PI, will conduct the review and make the decision to resume, amend or close the study for the Grade 3 or higher AEs that meet criteria for pausing the study. As part of the pause review, the reviewers will also advise on whether the study needs to be paused again for any subsequent events of the same type. The FDA and the IRB will be notified of Grade 3 or higher pause reviews and of the IND Sponsor's decisions.

## 5. SAFETY AND ADVERSE EVENT REPORTING

### 5.1 Adverse Events

An AE is any untoward or unfavorable medical occurrence in a human subject, including any abnormal sign (e.g., abnormal physical exam or laboratory finding), symptom, or disease temporally associated with the use of study treatment, whether considered related to the study treatment.

AEs will be graded according to the *DAIDS Table for Grading the Severity of Adult and Pediatric Adverse Events* (see Appendix IV).

Reporting of all AEs will occur during the period from study product administration at Day 0 through 28 days after study product administration. From Day 28 through completion of study participation, only SAEs and new chronic medical conditions that require ongoing medical management will be recorded as AEs in the study database.

### 5.2 Serious Adverse Events

An SAE is defined in 21 CFR 312.32 as follows: “An adverse event or suspected adverse reaction is considered serious if, in the view of either the investigator or the sponsor, it results in any of the following outcomes: Death, a life-threatening adverse event, inpatient hospitalization or prolongation of existing hospitalization, a persistent or significant incapacity or substantial disruption of the ability to conduct normal life functions, or a congenital anomaly/birth defect. Important medical events that may not result in death, be life-threatening, or require hospitalization may be considered serious when, based upon appropriate medical judgment, they may jeopardize the patient or subject and may require medical or surgical intervention to prevent one of the outcomes listed in this definition. Examples of such medical events include allergic bronchospasm requiring intensive treatment in an emergency room or at home, blood dyscrasias or convulsions that do not result in inpatient hospitalization, or the development of drug dependency or drug abuse.”

“Life-threatening” refers to an AE that at occurrence represents an immediate risk of death to a subject. An event that may cause death if it occurs in a more severe form is not considered life-threatening. Similarly, a hospital admission for an elective procedure is not considered a SAE.

### 5.3 Adverse Event Reporting to the IND Sponsor

AEs that meet SAE Reporting Requirements must be reported and submitted by the clinical site on an expedited basis to the IND Sponsor, VRC/NIAID/NIH, according to Sponsor guidelines as follows:

- results in death
- is life threatening
- results in persistent or significant disability/incapacity
- requires unplanned inpatient hospitalization or prolongation of existing hospitalization
- is a congenital anomaly/birth defect in the offspring of a study subject
- is an important medical event that may jeopardize the subject or may require intervention to prevent one of the other outcomes listed above.

In addition, any event, regardless of severity, which in the judgment of an investigator represents a SAE, may be reported on an expedited basis.

An investigator will communicate an initial SAE report within 24 hours of site awareness of occurrence to the IND sponsor by email to the VRC Protocol Operations Office (see Appendix II).

A written report by the investigator should be submitted to the IND Sponsor within 3 working days. In order for the IND Sponsor to comply with regulations mandating sponsor notification of specified SAEs to the FDA within 7 and/or 15 calendar days, the investigator must submit additional information as soon as it is available.

### 5.3.1 IND Sponsor Reporting to the FDA

It is the responsibility of the IND Sponsor to make the determination of which SAEs are “serious and unexpected suspected adverse reactions” (SUSARs) as defined in 21 CFR 312.32.

- *Suspected adverse reaction* means any AE for which there is a reasonable possibility that the drug caused the AE.
- *Unexpected adverse event* means an AE that is not listed in the IB or is not listed at the specificity or severity that has been observed.

All SUSARs, as determined by the IND Sponsor, will be reported to the FDA as IND Safety Reports and IND Safety Reports will be provided to the IRB.

The IND Sponsor will also submit an IND Annual Report of the progress of the investigation to the FDA as defined in 21 CFR 312.33.

## 5.4 Reporting to the Institutional Review Board

### 5.4.1 Unanticipated Problem (UP) Definition

An Unanticipated Problem (UP) is defined as any incident, experience, or outcome that meets all three of the following criteria:

- unexpected in nature, severity, or frequency in relation to the research risks that are described in the protocol, informed consent, IB, other study documents or in consideration of the characteristics of the subject population being studied; **and**
- related to participation in the research; **and**
- suggests that the research places subjects or others at a greater risk of harm (including physical, psychological, economic, or social harm) than was previously known or recognized.

**Serious UP:** An UP that meets the definition of a SAE or compromises the safety, welfare or rights of subjects or others.

An UP that is not an Adverse Event (UPnonAE) is an unanticipated problem that does not fit the definition of an AE, but which may, in the opinion of the investigator, involve risk to the subject, affect others in the research study, or significantly impact the integrity of research data. Such events would be considered a non-serious UP. For example, we will report occurrences of breaches of confidentiality, accidental destruction of study records or samples, or unaccounted-for study drug.

### 5.4.2 Protocol Deviation Definition

A Protocol Deviation is defined as any change, divergence, or departure from the IRB-approved study procedures in a research protocol. Protocol deviations are designated as serious or non-serious and further characterized as follows:

- Those that occur because a member of the research team deviates from the protocol.
- Those that are identified before they occur but cannot be prevented.
- Those that are discovered after they occur.

Serious Protocol Deviation: A deviation that meets the definition of a SAE or compromises the safety, integrity of the data, welfare or rights of subjects or others.

### 5.4.3 Non-Compliance Definition

Non-compliance is the failure to comply with applicable NIH Human Research Protections Program (HRPP) policies, IRB requirements, or regulatory requirements for the protection of human subjects. Non-compliance is further characterized as serious, continuing or minor.

“Serious non-compliance” is defined as non-compliance that:

- Increases risks, or causes harm, to subjects
- Decreases potential benefits to subjects
- Compromises the integrity of the NIH-HRPP
- Invalidates the study data

“Continuing non-compliance” is non-compliance that is recurring.

“Minor non-compliance” is non-compliance that is neither serious nor continuing.

### 5.4.4 Expedited Reporting to the IRB

The following will be reported to the NIAID IRB within 7 calendar days of investigator awareness:

- Serious and non-serious UP
- Deaths
- Serious protocol deviations
- Serious or continuing non-compliance
- SAEs that are possibly, probably, or definitely related to the research regardless of expectedness

The following waiver applies to reporting anticipated protocol deviations and expected UPnonAEs: Anticipated deviations in the conduct of the protocol will not be reported to the IRB unless they occur at a rate greater than anticipated by the study team. Expected AEs will not be reported to the IRB unless they occur at a rate greater than that known to occur in healthy adults. If the rate of these events exceeds the rate expected by the study team, the events will be classified and reported as though they are unanticipated problems.

### 5.4.5 Annual Reporting to the IRB

The following will be reported to the NIAID IRB in summary at the time of Continuing Review:

- Serious and non-serious UPs
- Expected SAEs that are possibly, probably, or definitely related to the research
- SAEs that are not related to the research
- All AEs, except expected AEs granted a waiver of reporting
- Serious and non-serious Protocol Deviations
- Serious, continuing, and minor non-compliance
- Any trends or events which in the opinion of the investigator should be reported

## 6. STATISTICAL CONSIDERATIONS

### 6.1 Overview

This is a Phase I, open-label, dose-escalation study of the safety and pharmacokinetics of a human monoclonal antibody, MAb114, administered intravenously to healthy adults.

### 6.2 Objectives

The primary objectives of the study are to evaluate the safety and tolerability of MAb114, to evaluate the pharmacokinetics of MAb114, and to estimate the half-life of MAb114 in serum.

### 6.3 Size and Accrual

#### 6.3.1 Sample Size Considerations

This study is primarily descriptive. For safety analysis, the goal is to identify safety concerns associated with different MAb114 dosages. There may be as few as 3 to 10 subjects in a group; therefore, this section considers group sizes of  $n=3$ , 5 and 10.

The ability to identify serious adverse experiences is best expressed by the maximum true rate of SAE that would unlikely be observed and the minimum true SAE rate that would very likely be observed. Within a group of size  $n=3$ , there is an 80% chance of observing at least 1 event if the true rate is no less than 0.42 and a 90% chance of observing no event if the true rate is no bigger than 0.035. Within a group of size  $n=10$ , there is at least an 80% chance of observing at least 1 event if the true rate is no less than 0.15 and at least a 90% chance of observing no event if the true rate is no bigger than 0.1.

Probabilities of observing 0 or more than 1 event are presented in **Table 4** for a range of possible true event rates. These calculations provide a complete picture of the sensitivity of this study design to identify potential safety problems with the study agent. For example, within the group of size  $n=3$ , if the true event rate is 0.1, then there is a 73% probability of observing no event and a 2.8% probability of observing more than 1 event; while, within the group of size  $n=10$ , if the true event rate is 0.1, then there is a 35% probability of observing no event and an 26% probability of observing more than 1 event.

**Table 4: Probability of Event for Different Scenarios**

True event rate	Within a group (n=3)		Within a group (n=5)		Within a group (n=10)	
	Pr (0 event observed)	Pr (more than 1 event observed)	Pr (0 event observed)	Pr (more than 1 event observed)	Pr (0 event observed)	Pr (more than 1 event observed)
0.05	0.857	0.007	0.774	0.023	0.599	0.086
0.1	0.729	0.028	0.590	0.081	0.349	0.264
0.2	0.512	0.104	0.328	0.263	0.107	0.624
0.3	0.343	0.216	0.168	0.472	0.028	0.851
0.4	0.216	0.352	0.078	0.663	0.006	0.954

**Table 5** gives the upper and lower bounds for 95% exact binomial confidence intervals (CIs) for all possible number of observed events within a group. Within the group of size n=3, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has an upper bound of 0.708; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.292. Within the group of size n=5, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has upper bound of 0.522; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.478. Within the group of size n=10, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has upper bound of 0.308; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.692.

**Table 5: 95% Confidence Intervals of the True Rate for All Possible Number of Observed Events Within a Group**

Within a group (n=3)		Within a group (n=5)		Within a group (n=10)	
Observed rate	95% CI	Observed rate	95% CI	Observed rate	95% CI
0/3	0, 0.708	0/5	0, 0.522	0/10	0, 0.308
1/3	0.008, 0.906	1/5	0.005, 0.716	1/10	0.002, 0.445
2/3	0.94, 0.992	2/5	0.053, 0.853	2/10	0.025, 0.566
3/3	0.292, 1	3/5	0.147, 0.947	3/10	0.067, 0.652
		4/5	0.284, 0.995	4/10	0.122, 0.738
		5/5	0.478, 1	5/10	0.187, 0.813
				6/10	0.262, 0.878
				7/10	0.348, 0.933
				8/10	0.444, 0.975
				9/10	0.555, 0.997
				10/10	0.692, 1

Tables 4 and 5 also apply to the secondary and exploratory objectives.

**6.4 Statistical Analysis**

**6.4.1 Analysis Variables**

The analysis variables consist of baseline, pharmacokinetic, and safety variables for the primary and secondary objective analyses.

**6.4.2 Baseline Demographics**

Baseline characteristics including demographics and laboratory measurements will be summarized using descriptive statistics.

**6.4.3 Safety Analysis**

Summaries of the number and percentage of subjects experiencing any AE or reactogenicity will be tallied by group and presented along with exact 95% confidence intervals for the proportion.

Solicited Adverse Events:

Solicited AE data is collected after each dose administered in this study. The number and percentage of subjects experiencing each type of solicited sign or symptom will be tabulated by severity. For a given sign or symptom, each subject’s solicited AEs will be counted once under the maximum severity for all assessments.

### Adverse Events:

Unsolicited AEs are coded into Medical Dictionary for Regulatory Activities (MedDRA) preferred terms. The number and percentages of subjects experiencing each specific AE will be tabulated by severity and relationship to treatment. For the calculations in these tables, each subject's adverse experience will be counted once under the maximum severity or strongest recorded causal relationship to treatment.

A complete listing of adverse experiences for each subject will provide details including severity, relationship to treatment type, onset, duration and outcome.

### Local laboratory values:

Boxplots of local laboratory values will be generated for baseline values and for values measured during the course of the study. Each boxplot will show the 1<sup>st</sup> quartile, the median, and the 3<sup>rd</sup> quartile. Outliers, or values outside the boxplot, will also be plotted. If appropriate, horizontal lines representing boundaries for abnormal values will be plotted.

## **6.4.4 Tolerability Evaluation**

The tolerability of the medical product represents the degree to which overt adverse effects can be tolerated by the subject [23]. VRC 608 is the first trial of MAb114 in healthy adults. The tolerability evaluation will be mostly descriptive by nature and consist of solicited AEs that occur during the 3 days following MAb114 administration and reasons for any withdrawal or discontinuation based upon subject discomfort. This early assessment of tolerability of MAb114 will inform which parameters should be solicited or routinely assessed to further characterize the tolerability profile in a larger number of subjects.

## **6.4.5 Pharmacokinetics Analysis**

Blood samples for PK evaluations will be collected at timepoints per the Schedule of Evaluations.

**Individual Subject PK Analysis:** A non-compartmental PK analysis will be performed using Phoenix (Centara) or a similar program on the MAb114 concentration data generated from each subject. Calculated PK parameters for all groups will include: area-under-the-curve (AUC), maximum concentration (C<sub>max</sub>), time to C<sub>max</sub> (T<sub>max</sub>), clearance (CL), volume of distribution (V<sub>d</sub>), terminal elimination rate constant ( $\lambda_z$ ) and the terminal half-life (T<sub>1/2</sub>). C<sub>max</sub> and T<sub>max</sub> will be taken directly from the observed concentration-time data. The terminal slope,  $\lambda_z$ , will be determined from the log-linear portion of the curve and the T<sub>1/2</sub> calculated as 0.693/ $\lambda_z$ . AUC<sub>0-C<sub>last</sub></sub> will be determined using the linear trapezoidal method, where C<sub>last</sub> is the concentration at 24 weeks after the dose. If the final sample (C<sub>last</sub>) has measurable MAb114 concentrations, the remaining AUC after the final concentration (AUC<sub>C<sub>last</sub>-inf</sub>) will be estimated as C<sub>last</sub>/ $\lambda_z$ . Data will be summarized by dose group.

**Population PK Analyses:** Population PK analyses will be performed on the MAb114 PK data following IV administration to determine compartmental PK parameters using the program NONMEM. One and two compartment PK models will be assessed. Based on prior PK studies of antibodies, it is anticipated that a two-compartment model will adequately characterize the data. The population analysis will generate estimates for initial and final volumes of distribution (V<sub>d1</sub> and V<sub>d2</sub>), inter-compartmental clearance (Q), CL and bioavailability (F). Volume of distribution at steady-state (V<sub>d<sub>ss</sub></sub>) will be calculated as the sum of V<sub>d1</sub> + V<sub>d2</sub>. Given the small subject numbers, the population PK analysis will not include an exploratory covariate analysis to assess clinical

factors as fixed effects associated with MAb114 PK parameters with the exception of dose (5 vs 25 vs 50 mg/kg) as fixed effects on CL and  $V_{d_{ss}}$ . The terminal half-life,  $t_{1/2\beta}$  will be determined from CL,  $V_{d1}$ ,  $V_{d2}$  and Q. Final model selection will be based on changes in the objective function and graphically by goodness of fit plots. The final population model will be assessed using bootstrap analysis. MAb114 dosing strategies and their ability to achieve and maintain target MAb114 concentrations will be performed using the final population PK model and Monte Carlo simulations with at least 5000 replicates.

#### 6.4.6 Interim Analyses

Preliminary PK analyses may be performed once per dose level as the data for each dose level is obtained. This will be used to inform decisions about the dose levels to be administered in studies that may begin while VRC 608 is still in progress.

### 7. PHARMACY PROCEDURES

The study groups and study product dosing schedule are shown in **Table 3**. Refer to the IB for further information about the investigational study product and administration regimen.

#### 7.1 Study Product and Administration Regimen

The study includes an investigational monoclonal antibody described as follows:

- VRC-EBOMAB092-00-AB (MAb114)

In this study, the amount of antibody needed for dosing is based on subject weight and treatment group assigned. In calculating the dose to administer, it should be assumed that the concentration of reconstituted MAb114 is 50 mg/mL, and that a volume of at least 8 mL can be withdrawn from a vial.

For example, if a subject is 80 kg, the volumes for clinical dosing per infusion would be as follows:

- If an 80 kg subject enrolled in Group 1 (5 mg/kg), 400 mg (8 mL) should be administered
- If an 80 kg subject enrolled in Group 2 (25 mg/kg), 2000 mg (40 mL) should be administered
- If an 80 kg subject enrolled in Group 3 (50 mg/kg), 4000 mg (80 mL) should be administered

Preparation of MAb114 for IV administration will require 0.9% sodium chloride, USP (normal saline). For all groups, normal saline (100 mL preferred) and weight-based amount of reconstituted MAb114 will be added to a sterile empty bag (250 mL preferred).

#### 7.2 Study Product Storage

The product label designates the long-term storage temperature as 2-8°C. The site pharmacist must promptly report any storage temperature excursions to the IND sponsor's authorized representative (Appendix II). The affected product must be quarantined in a separate area. The IND Sponsor's authorized representative will notify the site pharmacist if continued clinical use of the product is acceptable.

### 7.3 Preparation of Study Product for Administration

This section describes how the site pharmacist will prepare the study product for administration and how the clinician will administer the product.

Preparation is to be done in a limited access, biological safety cabinet with laminar flow using aseptic technique. During preparation, the pharmacist should assure that only the required vials are present in the preparation unit, and medication labels are strictly segregated to avoid mix-ups.

The following instructions apply to preparing the product for infusion:

1. Calculate the total amount of MAb114 (mg) needed based on the subject's weight and assigned dose level.
2. Remove vial(s) from storage and equilibrate to room temperature for at least 20 minutes
3. Add 7.7 mL of SWFI to each vial
4. Gently mix the vial by swirling, stopping every 30 seconds to let the vial sit on the counter for 10 seconds, until reconstitution is complete. Reconstituted product should be a clear, light yellow liquid, essentially free of visible particles. It may take up to 30 minutes to achieve a completely clear (particle free) solution. If particles are still observed in a vial, the vial should not be used for product administration.

Reconstituted or diluted drug product will be maintained for no more than 4 hours at room temperature or 24 hours at 2°-8°C prior to administration.

More information on product preparation can be found in the IB.

It is expected that each vial will be used for the 8 mL withdrawal volume (400 mg of MAb114); however, more may be withdrawn if it is possible to do so. For each IV infusion order, the subject's weight and dose level will be included in the pharmacy order.

To prepare an IV infusion, the pharmacist will fill an empty sterile bag (250 mL preferred) with normal saline (100 mL preferred), calculate the total amount of MAb114 (mg) needed, reconstitute the minimum number of vials needed to obtain the full dose and add the calculated total mg needed to the sterile bag filled with normal saline (100 mL preferred) using good pharmacy practices to maintain sterility.

An in-line filter infusion set must be used for all IV product administrations. The pharmacist should add the in-line filter to the tubing and prime the set prior to delivery to the clinical setting. In-line filters must comply with the following specifications: 1.2 micron PES (polyether sulfone) filter membrane, DEHP-free, latex-free.

The IV bag prepared by the pharmacy will include the total amount (mg) of MAb114 added to normal saline in an empty sterile bag, and an in-line filter infusion set.

Before beginning the IV administration, the clinician responsible for administration and another clinician will each check the bag label and verify the identifier, the dosage level, that the total amount of product to be administered is correct based on the subject's weight, and that the filter is in place.

The investigational study product solution will typically be administered by IV infusion for approximately 30 minutes, based on factors such as subject tolerance, using a volumetric pump. Longer infusion times will be allowed if clinically warranted.

## 7.4 Labeling of Study Product

Vials of study product will be individually labeled with the name of the material, lot number, concentration, storage instructions, Investigational Use Statement (“Limited by Federal Law to Investigational Use”), and manufacturer information.

## 7.5 Study Product Accountability

The study pharmacist will be responsible for maintaining an accurate record of the codes, inventory, and an accountability record of study product supplies. Electronic documentation as well as paper copies may be used.

## 7.6 Study Product Disposition

The empty vials and the unused portion of a vial will be discarded in a biohazard containment bag and incinerated or autoclaved after use. Any unopened vials that remain at the end of the study will be returned to the production facility or discarded at the discretion of the sponsor in accordance with policies that apply to investigational products. Partially used vials will not be administered to other subjects or used for *in vitro* experimental studies. These vials will be disposed of in accordance with institutional or pharmacy policy.

# 8. HUMAN SUBJECT PROTECTIONS AND ETHICAL OBLIGATIONS

This research study will be conducted in compliance with the protocol, International Council for Harmonisation’s Good Clinical Practice (ICH-GCP) guidance, and all applicable regulatory requirements.

## 8.1 Informed Consent

The study informed consent form (ICF) is provided in Appendix I. It describes the study product to be used and all aspects involved in protocol participation.

The PI or designee is responsible for obtaining written informed consent from each subject after adequate explanation of the aims, methods, anticipated risks and benefits of the study and before any protocol-specific procedures are conducted or the study product is administered. The AoU will be completed before the study ICF is signed.

The acquisition of informed consent will be documented in the subject’s medical records, as required by 21 CFR 312.62. The ICF will be signed and personally dated by the subject, the person who conducted the informed consent discussion, and a witness. The original signed ICF will be retained in the medical chart and a copy will be provided to the subject.

## 8.2 Risks and Benefits

### 8.2.1 Risks

MAb114: There is no prior human experience with administration of MAb114.

MAbs: Administration of MAbs may cause immune reactions such as acute anaphylaxis, serum sickness and the generation of antibodies. However, these reactions are rare and more often associated with MAbs targeted to human proteins or with the use of murine MAbs that would have

a risk of human anti-mouse antibodies [24]. In this regard, because MAb114 is targeted to a viral antigen and is a human MAb, it is expected to have a low risk of such side effects.

Typically, the side effects of MAbs are mild to moderate and may include fever, chills, rigors, nausea, vomiting, pain, headache, dizziness, shortness of breath, bronchospasm, hypotension, hypertension, pruritus, rash, urticaria, angioedema, diarrhea, tachycardia or chest pain. Clinical use of MAbs that are targeted to cytokines or antigens associated with human cells may be associated with an increased risk of infections [24]; however, this is not expected to be a risk for a MAb targeted to a viral antigen.

Published experience with human MAbs directed against the cell surface targets on lymphocytes shows that infusion of a MAb may be associated with cytokine release, causing a reaction known as cytokine release syndrome (CRS) [25]. Most infusion-related events occur within the first 24 hours after beginning administration. Severe reactions, such as anaphylaxis, angioedema, bronchospasm, hypotension and hypoxia, are infrequent and more often associated with MAbs targeted to human proteins or with non-human MAb, such as a murine MAb [24]. CRS reactions most commonly occur within the first few hours of beginning infusion and with the first MAb infusion received. This is because the cytokine release is associated with lysis of the cells targeted by the MAb and the burden of target cells is greatest at the time of the first MAb treatment. With licensed therapeutic MAbs, CRS is managed by temporarily stopping the infusion, administering histamine blockers and restarting the infusion at a slower rate [26]. Supportive treatment may also be indicated for some signs and symptoms. Delayed allergic reactions to a MAb may include a serum sickness type of reaction, which is characterized by urticaria, fever, lymph node enlargement, and joint pains. Symptoms may not appear until several days after the exposure to the MAb. This type of reaction is noted to be more common with chimeric types of MAb [24]. In general, and with due consideration of the needs dictated by individual subject symptoms and treating clinician discretion, immediate and delayed reactions to study product would be managed according to the principles of the American Academy of Allergy, Asthma, and Immunology guidelines established in the Drug Allergy: Practice Parameters (2010).

Participation in this study may limit a subject's eligibility for future MAb studies.

**Risks of Blood Drawing:** Blood drawing may cause pain and bruising and, infrequently, may cause a feeling of lightheadedness or fainting. Rarely, it may cause infection at the site where blood is taken. In this study, an IV line that can be used for blood collection may be placed in the arm and left in place for several hours on Day 0 for frequent PK blood draws. Problems from use of an IV for blood drawing are generally mild and may include pain, bruising, minor swelling or bleeding at the IV site and rarely, infection, vein irritation (phlebitis), or blood clot.

### **8.2.2 Benefits**

There are no direct benefits to subjects from study participation. Others may benefit from knowledge gained in this study that may aid in the development of EVD prevention or therapeutic methods.

### **8.3 Institutional Review Board**

A copy of the protocol, ICF, other written subject information, and any advertising material will be submitted to the IRB for written approval prior to implementation.

The investigator must submit and, where necessary, obtain approval from the IRB for all subsequent

protocol amendments and changes to the informed consent document. The investigator will notify the IRB of unanticipated problems, non-compliance, deviations from the protocol, and SAEs per IRB policy.

The investigator will be responsible for obtaining IRB approval of the annual Continuing Review throughout the duration of the study.

#### **8.4 Subject Confidentiality**

The investigator must ensure that no information identifying the subject will be released to any unauthorized party. Individual identifying information will not be included in any reports. Subjects will be identified only by coded numbers. All records will be kept confidential to the extent provided by federal, state and local law. Medical records are made available for review when required by the FDA or other authorized users, such as the study product manufacturer, only under the guidelines set by the Federal Privacy Act. Direct access includes examining, analyzing, verifying, and reproducing any records and reports that are important to the evaluation of the study. The investigator is obligated to inform the subjects that the above-named representatives will review their study-related records without violating the confidentiality of the subjects.

#### **8.5 Plan for Use and Storage of Biological Samples**

The plan for use and storage of biological samples from this protocol is as outlined as follows.

##### **8.5.1 Use of Samples, Specimens and Data**

Samples, specimens and data collected under this protocol may be used to conduct protocol-related safety and immunology evaluations, exploratory laboratory evaluations related to the biological target of the study product, exploratory laboratory evaluations related to vaccine or infectious disease research in general and for research assay validation. Genetic testing may be performed in accordance with the genetic testing information that is included in the study informed consent.

##### **8.5.2 Storage and Tracking of Blood Samples and Other Specimens**

All research samples use coded labels that only the VRC Clinic can link to the subject. Samples are stored at the VITL, Gaithersburg, MD or VRC Laboratories in Building 40, which are both secure facilities with limited access. Data will be kept in password-protected computers. Only investigators or their designees will have access to the samples and data. Samples will be tracked in the Laboratory Information Management System (LIMS) database or using another software designed for this purpose (e.g., Freezerworks or GlobalTrace).

##### **8.5.3 Disposition of Samples, Specimens and Data at Completion of the Protocol**

In the future, other investigators (both at NIH and outside) may wish to study these samples and/or data. IRB approval must be sought prior to any sharing of samples. Any clinical information shared about those samples would similarly require prior IRB approval. The research use of stored, unlinked or unidentified samples may be exempt from the need for prospective IRB review and approval. Exemption requests will be submitted in writing to the NIH Office of Human Subjects Research, which is authorized to determine whether a research activity is exempt.

At the time of protocol termination, samples will remain in the VITL facility or VRC laboratories or, after IRB approval, transferred to another repository. Regulatory oversight of the stored samples and data may be transferred to a stored samples protocol as part of the IRB-approved termination

plan. Data will be archived by the VRC in compliance with requirements for retention of research records, or after IRB and study sponsor approval, it may be either destroyed or transferred to another repository.

#### **8.5.4 Loss or Destruction of Samples, Specimens or Data**

Any loss or unanticipated destruction of samples (e.g., due to freezer malfunction) or data (e.g., misplacing a printout of data with identifiers) that compromises the scientific integrity of the study will be reported to the IRB in accordance with institutional policies. The PI will also notify the IRB if the decision is made to destroy the remaining samples.

### **8.6 Subject Identification and Enrollment**

All study activities will be carried out at the NIH CC. Study subjects will be recruited through on-site and off-site advertising done through the screening protocol, VRC 500 (NCT 01375530) (<https://clinicaltrials.gov/ct2/show/NCT01375530?term=VRC+500&rank=1>). Effort will be made to include women and minorities in proportions similar to that of the community from which they are recruited and will be limited to persons at least 18 years of age and no older than 60 years of age at enrollment.

#### **8.6.1 Participation of Children**

Children are not eligible to participate in this clinical trial because the study product has not been previously evaluated in adults. If the product is assessed as safe for further study, other protocols specifically designed for children may be conducted.

#### **8.6.2 Participation of NIH Employees**

NIH employees and members of their immediate families may participate in this protocol. The VRC clinic will follow the NIH Guidelines for the Inclusion of Employees in NIH Research Studies.

The NIH information sheet “NIH Information Sheet on Employee Research Participation.” regarding employee research participation will be distributed to all potential subjects who are NIH employees. The employee subject’s privacy and confidentiality will be preserved in accordance with NIH CC and NIAID policies. Neither participation nor refusal to participate will have an effect, either beneficial or adverse, on the subject’s employment or work situation. For NIH employee subjects, consent will be obtained by an individual who is independent of the employee’s team. If the individual obtaining consent is a co-worker to the subject, independent monitoring of the consent process will be provided through the Bioethics Consultation Service. Protocol study staff will be trained on obtaining potentially sensitive and private information from co-workers or subordinates.

### **8.7 Compensation**

Subjects will be compensated for time and inconvenience in accordance with the standards for compensation of the Clinical Research Volunteer Program. Compensation for study product administration and PK blood draws on the same day will be \$375. The compensation will be \$175 for scheduled visits that include blood draws, \$75 for clinic visits that do not include a blood draw or procedure, and \$25 for timely completion of the electronic diary.

## 8.8 Safety Monitoring

Close cooperation between the designated members of the Protocol Team will occur to evaluate and respond to individual AEs in a timely manner. The designated VRC Safety Officer will conduct a daily safety review of clinical data per VRC Standard Operating Procedures. The PSRT, comprised of the PI, Associate Investigators, Study Coordinator, Protocol Specialists, other Study Clinicians, and MO will review the summary study safety data reports on a weekly basis through 4 weeks after the last subject receives the study product and will continue to monitor the safety data reports monthly through completion of the last study visit.

## 9. ADMINISTRATIVE AND LEGAL OBLIGATIONS

### 9.1 Protocol Amendments and Study Termination

Protocol amendments may be made only with the prior approval from the IND Sponsor. Agreement from the PI and MO must be obtained for all amendments to the protocol and the informed consent document. All study amendments will be submitted to the IRB for approval.

The IND Sponsor, NIAID IRB, OHRP, study PI, and FDA reserve the right to terminate the study at any time. The PI will notify the IRB in writing of the study's completion or early termination.

### 9.2 Study Documentation and Storage

The PI will maintain a list of appropriately qualified persons to whom trial duties have been delegated.

Source documents are original documents, data, and records from which the subject's data are obtained. These include but are not limited to hospital records, clinical and office charts, laboratory and pharmacy records, microfiches, radiographs, and correspondence.

The PI and staff are responsible for maintaining a comprehensive and centralized filing system of all study-related (essential) documentation, suitable for inspection at any time by representatives from the VRC, IRB, FDA, and/or applicable regulatory authorities. Elements include:

- Subject files containing completed informed consent forms, and supporting copies of source documentation (if kept)
- Study files containing the protocol with all amendments, IBs, copies of all correspondence with the IRB and the VRC

In addition, all original source documentation must be maintained and be readily available.

All essential documentation should be retained by the institution for the same period of time required for medical records retention. The FDA requires study records to be retained for up to two years after marketing approval or refusal (21 CFR 312.62). No study document should be destroyed without prior written agreement between the VRC and the investigator. Should the investigator wish to assign the study records to another party or move them to another location, they must notify the VRC in writing of the new responsible person and/or the new location.

### **9.3 Study Monitoring, Data Collection and Data Sharing**

#### **9.3.1 Study Monitoring**

The VRC/NIAID, VRC regulatory and regulatory authority inspectors or their authorized representatives are responsible for contacting and visiting the PI for the purpose of inspecting the facilities and, upon request, inspecting the various records of the trial, provided that subject confidentiality is respected.

Site visits by study monitors will be made in accordance with the IND Sponsor policy to monitor the following: study operations, quality of data collected in the research records, accuracy and timeliness of data entered in the database, and that all process and regulatory requirements are met.

Site investigators will allow the study monitors, the IRB, and FDA to inspect study documents (e.g., consent forms, drug distribution forms, case report forms) and pertinent hospital or clinic records for confirmation of the study data.

#### **9.3.2 Data Collection**

Clinical research data will be collected in a secure electronic data management system through a contract research organization, The EMMES Corporation (Emmes) in Rockville, MD. Extracted data without patient identifiers will be sent to the PSRT for safety review and to the Protocol Statistician for statistical analysis.

#### **9.3.3 Data Sharing Plan**

Data generated in this study will be shared as de-identified data in the government-funded public repository, [www.ClinicalTrials.gov](http://www.ClinicalTrials.gov). Data may be shared prior to publication at approved public presentations or for collaborative development and will be shared at the time of publication or within 1 year of the primary completion date.

### **9.4 Language**

All written information and other material to be used by subjects and investigative staff must have vocabulary and language that are clearly understood.

### **9.5 Policy Regarding Research-Related Injuries**

The NIH CC will provide short-term medical care for any injury resulting from participation in this research. In general, the NIH, the NIH CC, or the U.S. Federal Government will provide no long-term medical care or financial compensation for research-related injuries.

**Visit Windows:**

Screening: Evaluations for eligibility must be completed with 84 days of enrollment as noted in Section 4.1.

Visit 01R and Day 0: Visit 01R may be done on the same day as Day 0. Visit 01R = day of enrollment. Day 0 = day of product administration. Day 0 is preferably scheduled within 14 days after enrollment at Visit 01R, but may be scheduled up to 28 days after enrollment. Day 0 evaluations prior to MAb114 administration are the baseline for assessing subsequent AEs.

EOI: End of infusion blood draw visits, defined by minutes or hours after an infusion, are relative to the exact time of the end of infusion (EOI). The exact time of start (T0), EOI and each PK draw are recorded to ensure accurate PK analysis. **It is preferable to draw PKs as close to target time as possible.**

Visit 02A: up to 10 minutes post EOI    Visits 02B, 02C: ± 10 minutes    Visit 02D: -2 hours    Visits 03, 04: ± 6 hours    Visit 05: ± 2 days

**Footnotes:**

<sup>1</sup> Day 0=day of product administration. Day 0 is preferably scheduled within 14 days after enrollment at Visit 01R, but may be scheduled up to 28 days after enrollment.

<sup>2</sup> Screening: All screening evaluations including laboratory tests, medical history and complete physical exam must be completed within 84 days of enrollment.

<sup>3</sup> Physical exam: Screening includes complete physical exam with vital signs, height and weight. Day 0 physical exam includes vital signs (blood pressure, temperature and pulse) and weight (used for ordering the study product which is based on a “mg/kg” dose). At other visits if medically indicated, a targeted exam is performed. Otherwise only blood pressure, pulse and temperature are required.

<sup>4</sup> Medical history: Screening, 01R and Day 0 evaluations include a complete medical history to evaluate eligibility criteria as defined in Section 4.1. At other visits, an interim medical history will be completed.

<sup>5</sup> Concomitant medications: Concomitant medications must be entered in the database at enrollment and updated as required in Section 4.2.7.

<sup>6</sup> Study product administration: Group 1 subjects will receive a single infusion of 5 mg/kg IV, Group 2 subjects will receive a single infusion of 25 mg/kg IV, and Group 3 subjects will receive a single infusion of 50 mg/kg IV.

<sup>7</sup> Administration Site Evaluation: Clinicians will assess the product administration site on Days 1, 2 and 7 and record any findings in the database. Any signs or symptoms unresolved by Day 7 should continue to be evaluated until resolved.

<sup>8</sup> Reactogenicity Diary: Subjects will begin to record 3-day systemic reactogenicity after study product administration as noted in Section 4.2.4. Clinicians will review with the subject at a minimum on Days 1, 2 and 7. If any reported reactogenicity is unresolved by Day 3, it will continue to be reviewed with the subject until resolved which may require an interim phone contact. Data from the diary will be recorded in the database as noted in Section 4.2.4.

<sup>9</sup> Pregnancy test and pregnancy prevention counseling are required at visits as indicated for women of reproductive potential. Negative pregnancy test results must be confirmed for women of reproductive potential prior to MAb114 administration.

<sup>†</sup> Anti-drug antibodies (ADA) will be assessed from serum samples taken at baseline, four weeks post-infusion, and 24 weeks post-infusion at the final protocol visit. Banked serum from any study visit may also be used for ADA assessment as indicated from observations in an individual subject prompting suspicion of ADA development, such as a precipitous drop in PK levels.

**Visit Windows:**

Visits 06 – 12: ± 2 days

Visits 13 – 16: ± 7 days

**Footnotes:**

<sup>1</sup> Physical exam: If medically indicated, a targeted exam is performed. Otherwise only blood pressure, pulse and temperature are required.

<sup>2</sup> Pregnancy test and pregnancy prevention counseling are required at visits as indicated for women of reproductive potential.

<sup>3</sup> Human leukocyte antigen (HLA) type blood sample: If the HLA type within 2 years is not available in the medical record, a blood sample will be collected once. HLA type may also be obtained from a frozen sample.

<sup>4</sup> PK samples: PK draws may be cancelled at Visits 15 and 16 if results from Visit 14 are available and show no detectable MAb114, however these visits will still be required.

<sup>†</sup> ADA assessed from serum samples as indicated. Banked serum from any study visit may also be used for ADA assessment.

## Appendix IV: Assessment of Relationship to Study Product and Adverse Event Severity Grading

### Assessment of Causality Relationship of an Adverse Event to Study Product:

The relationship between an adverse event (AE) and the product will be assessed by the investigator on the basis of his or her clinical judgment and the definitions below.

- **Definitely Related.** The AE and administration of study product are related in time, and a direct association can be demonstrated.
- **Probably Related.** The AE and administration of study product are reasonably related in time, and the AE is more likely explained by study product than other causes.
- **Possibly Related.** The AE and administration of study product are reasonably related in time, but the AE can be explained equally well by causes other than study product.
- **Not Related.** There is not a reasonable possibility that the AE is related to the study product.

For purposes of preparing data reports in which AE attributions are limited to “**Related**” or “**Not Related**”, in this protocol, the “**Definitely, Probably and Possibly**” attributions will be mapped to the “**Related**” category. The definitions that apply when these two categories alone are used are as follows:

- **Related** – There is a reasonable possibility that the AE may be related to the study product.
- **Not Related** – There is not a reasonable possibility that the AE is related to the study product.

### Grading the Severity of Adverse Events:

The U.S. Department of Health and Human Services, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Division of AIDS. Division of AIDS (DAIDS) Table for Grading the Severity of Adult and Pediatric Adverse Events, Corrected Version 2.1. [July 2017] will be used in this study. The table is available at the following link: <https://rsc.tech-res.com/docs/default-source/safety/daidsgradingcorrectedv21.pdf>

The Table will be used as posted at the link above with the following exemptions:

- Weight loss will be recorded as an adverse event only if it is considered deleterious to the participant’s health.
- For severity grading of the solicited bruising parameter at the product administration site, the definitions based on size of the largest diameter and listed for the “Injection Site Erythema or Redness” will be used. The severity grade definition for “Bruising” provided under the Dermatologic Clinical Conditions will be used only for unsolicited AEs involving bruising at other body locations.
- Subclinical CMP results for sodium, potassium, chloride, bicarbonate, BUN, and glucose will not be considered an AE unless grade 2 or greater.

- Creatinine changes will be graded on the basis of the upper limit of normal provided by the grading table and not change from baseline.
- Creatinine clearance changes will be graded according to ml/min provided by the grading table and not change from baseline.

### INTRODUCTION

We invite you to take part in a research study at the National Institutes of Health (NIH).

First, we want you to know that:

- Taking part in NIH research is entirely voluntary.
- You may choose not to take part, or you may withdraw from the study at any time. In either case, you will not lose any benefits to which you are otherwise entitled. However, to receive care at the NIH, you must be taking part in a study or be under evaluation for study participation.
- You may receive no benefit from taking part. The research may give us knowledge that may help people in the future.

Second, some people have personal, religious or ethical beliefs that may limit the kinds of medical or research treatments they would want to receive (such as blood transfusions). If you have such beliefs, please discuss them with your NIH doctors or research team before you agree to the study.

Now we will describe this research study. Before you decide to take part, please take as much time as you need to ask any questions and discuss this study with anyone at NIH, or with family, friends or your personal physician or other health professional.

### PURPOSE AND PLAN OF THE STUDY

Ebola is a virus that has infected and killed people mostly in West Africa. There is no approved, effective treatment or prevention for Ebola, but several drugs are being studied for this purpose.

In this study, we are testing an experimental drug called "MAB114". Experimental means that MAB114 has not been approved by the United States (U.S.) Food and Drug Administration (FDA), but the FDA gave us permission to test it in research studies. It is not known if MAB114 works to prevent or treat Ebola infection, so the FDA only allows it to be used for research.

The main purpose of this study is to see if MAB114 is safe and how your body will respond to it. We will give you MAB114 and measure how much stays in your body over time. We will also check to see if your immune system makes

### PATIENT IDENTIFICATION

### CONSENT TO PARTICIPATE IN A CLINICAL RESEARCH STUDY

• Adult Patient or • Parent, for Minor Patient  
NIH-2514-1 (07-09)  
P.A.: 09-25-0099  
File in Section 4: Protocol Consent (1)

**MEDICAL RECORD****CONTINUATION SHEET for either:**

NIH 2514-1, Consent to Participate in A Clinical Research Study

NIH 2514-2, Minor Patient's Assent to Participate In A Clinical Research Study

STUDY NUMBER: 18-I-0069

CONTINUATION: Page 2 of 8 pages

antibodies to MAb114 that prevent it from working.

We are testing 3 different doses of MAb114 in this study.

The Study Groups are shown in the following table:

Group	Subjects	Schedule
		Day 0
1	3	5 mg/kg IV
2	5	25 mg/kg IV
3	10	50 mg/kg IV
Total	18	More people may be enrolled, if needed, to reach the study goals.

The study will start by giving the smallest dose of MAb114 to people in Group 1. After the first person in a group gets a dose of MAb114, we will wait 3 days before giving the dose to the second person. We will wait 7 days after the last person in Group 1 gets a dose and review the safety data for all people in Group 1. If no safety concerns are identified with the dose in Group 1, then Group 2 will open. Likewise, if no safety concerns are identified with the dose in Group 2 after the safety data review, then Group 3 will open. The exact amount of MAb114 that you get will be based on the group you are in and how much you weigh.

About 18 to 30 people will take part in this study at the NIH Clinical Center in Bethesda, Maryland.

**ELIGIBILITY**

You are eligible to take part in this study because you have completed the screening process and:

- 18 to 60 years old
- In good general health
- Willing to get MAb114
- Willing to donate blood samples for future research
- Willing to use birth control for the whole study
- Have not received a licensed or investigational monoclonal antibody or Ebola vaccine in the past
- Weigh less than 220 pounds

**STUDY DRUG**

MAb114 is a monoclonal antibody or "MAb" that targets the Ebola virus. Antibodies are made by the immune system to fight infection by blocking germs (bacteria and viruses) like Ebola. Monoclonal means that all the antibodies in MAb114 are exactly the same.

MAb114 was developed at the Vaccine Research Center (VRC) at NIH. It is made in a laboratory and looks like an antibody your own body could make. It has shown promise as an Ebola treatment in laboratory and animal studies, but it has not yet been studied in humans. This is the first study to give MAb114 to humans.

MAb114 will not protect you from Ebola infection. You cannot get Ebola from MAb114 because there is no Ebola virus in it.

**PATIENT IDENTIFICATION****CONTINUATION SHEET for either:**

NIH-2514-1 (10-84)

NIH-2514-2 (10-84)

P.A.: 09-25-0099

STUDY NUMBER: 18-I-0069

CONTINUATION: Page 3 of 8 pages

**STUDY SCHEDULE AND PROCEDURES**

**First study visit:** If you agree to take part in this study, you will get one dose of MAb114 at your first study visit after enrolling in the study. You cannot choose the dose of MAb114 you get. The dose you get will depend on when you join the study and how much you weigh. This visit will be at the Clinical Center and will take about 8-10 hours.

If you are female and able to become pregnant, you must use an effective method of birth control for the entire study. A pregnancy test will be done before you get MAb114. If you are pregnant, we will not give you MAb114.

You will get MAb114 by intravenous (IV) infusion. This means we will place a thin tube or IV line in a vein in your arm. The IV line will be attached to a bag that contains MAb114 mixed with a liquid called "normal saline" or salt water. It will flow into your vein for about 30 minutes. If you have side effects during the infusion, it may be slowed down or stopped as needed. At the end of your infusion, we will monitor you for any side effects for at least 4 hours.

If possible, we will also place an IV line in your other arm for blood collection during this visit. We will draw your blood before and right after the infusion, and then 3 more times during the 4-6 hours after the infusion. Blood draw volumes will be within NIH Clinical Center limits. You will be allowed to go home about 4-6 hours after the infusion, as long as you do not have concerning side effects.

We will give you a thermometer and ask you to check your temperature every day for 3 days after you get MAb114. You will need to record your highest temperature and any symptoms you may have. Even if you do not feel sick, it is still very important that you record this information. We will give you a password to a secure website to record this information on an electronic form or diary. If you do not have a computer, you may use a paper diary instead.

If you have any side effects after you get MAb114, you should tell a VRC nurse or doctor as soon as possible. You can reach the clinic staff by phone 24 hours a day. If you have symptoms, you may be asked to come into the clinic for an examination before your next scheduled visit. It is very important that you follow the instructions from the clinic staff.

**Follow-up visits:** You will return to the Clinical Center for about 14 more study visits over a 6-month period. These visits will take about 1-2 hours. We will discuss the exact schedule of these visits with you. At each follow-up visit, we will draw your blood and check you for any health changes or problems. We will ask you how you are feeling and if you have taken any medications. You will have about 2-8 tubes of blood drawn at each visit for safety and research tests. Blood draw volumes will be within NIH Clinical Center limits. We will tell you right away if any of your test results show a health problem. You might need to have extra clinic visits and laboratory tests if you have health changes that need to be checked. We will use some of the blood to see how long MAb114 remains in your body. We will also use some of the blood to see if your immune system makes antibodies to MAb114. These tests are for research purposes only and are not for checking on your health. We will not give you these results.

When you complete this study after about 6 months, we may invite you to take part in another study for follow-up sample collection.

Clinical studies follow a set schedule. This helps us answer the research questions. The visit schedule is a little flexible, but it is important that you follow the schedule as closely as possible. You should try to not miss any visits. You should contact the clinic staff as soon as possible if you need to change the date or time of any study visit.

STUDY NUMBER: 18-I-0069

CONTINUATION: Page 4 of 8 pages

**MONITORING OF THE STUDY**

A group of physicians and scientists at NIH will monitor safety in this study. This group will review the information from the study and will pay close attention to possible harmful reactions.

**GENETIC TESTING**

Some of the blood drawn from you as part of this study will be used for genetic tests. Some genetic tests may be done to see if genetic differences in people cause different types of immune responses. Genetic tests that are done in our research lab using your research blood sample will not have your name on it and the results will not be in your medical record. These tests are not used to check your health and we will not tell you the results.

A special genetic test, called Human Leukocyte Antigen (HLA) typing, is done by the NIH Clinical Center medical laboratory. These results will be in your medical record, but they will not be used to check your health. Any genetic testing, including HLA testing, is for research purposes only. Any genetic information collected or learned about you will be kept confidential. Medical records, including HLA test results, are kept securely. We will not give any genetic information that is in your medical record to anyone without your permission.

**STORED SAMPLES**

We will collect blood samples from you during the study. We will keep these samples for future research to learn more about monoclonal antibodies, vaccines, the immune system, and/or other medical conditions. Results from research with your samples will not be in your medical record or reported to you.

**Labeling of Stored Samples:** We will label your stored samples by a special code or number. Only the study team can link this code to you. Any identifying information about you (like name or date of birth) will be kept as confidential as allowable by law. Despite protections, there is a small chance that information identifying you will be given to someone who should not get it.

**Risks from Stored Samples:** There is a risk of unplanned release of information from your medical records. The chance that this information will be given to an unauthorized person without your permission is very small. Possible problems with the unplanned release of information include discrimination when applying for insurance and employment. Similar problems may occur if you give information about yourself or agree to have your medical records released.

**Future Studies:** In the future, other investigators (at NIH or outside of NIH) may wish to study your stored samples. When your stored samples are shared, they will be marked with a code. Your samples will not have any identifying information on them. Some information about you, such as your gender, age, health history, or ethnicity may also be shared with other researchers.

Any future research studies using your samples will be conducted in a way that protects the rights and privacy of study participants.

Your stored samples will be used only for research and will not be sold. The research done with your materials may be used to develop new products in the future, but you will not get payment for such products.

STUDY NUMBER: 18-I-0069

CONTINUATION: Page 5 of 8 pages

**Making your Choice:** You cannot take part in this study if you do not want us to collect or store your blood samples. If you agree to take part in this study, you must also agree to let us keep any of your samples for future research. If you decide not to take part in this study, you may still take part in other studies at NIH.

**HUMAN DATA SHARING**

To advance science, it is helpful for researchers to share information they get from studying humans by putting it into shared scientific databases. Researchers can then study the information combined from many studies to learn even more about health and diseases.

If you agree to take part in this study, some of your data will be placed into one or more scientific databases. We will remove identifying information like your name, address, and birth date. The data may then be used for future research and shared broadly for research purposes. Only researchers who are approved to access the database may be able to see and use your information. You will not get any direct benefits from future research that uses your data and information.

You may stop participating in this study at any time and withdraw permission for your individual data, specimens, and health information to be used for additional or future research. You may ask to have your research data destroyed. However, it may not be possible to withdraw or delete data once they have been shared with other researchers.

**POSSIBLE STUDY RISKS**

**Risks of MAb114 and similar antibodies:** This study is the first time that MAb114 is given to people. As of July 24, 2018, 13 subjects in this study have received a single dose of MAb114 administered IV. Product administrations appear to be safe and well tolerated, without safety concerns identified. Some people who received MAb114 reported mild symptoms including headache, feeling unwell, muscle aches, chills, and joint pain. **There may be risks and side effects that we don't know about yet.**

We do have data from other monoclonal antibodies that are approved for use in people and are also given by IV. Like other drugs, monoclonal antibodies can cause side effects, some of which can be serious. Most side effects occur within the first 24 hours. These may include fever, chills, shaking, nausea, vomiting, pain, headache, dizziness, trouble breathing, high or low blood pressure, itchiness, rash, hives, lip or face swelling, diarrhea, racing heart, or chest pain.

We are giving MAb114 at a controlled rate. If you have symptoms while getting MAb114, tell the nurse. Slowing or stopping the infusion may help improve the symptoms.

Some antibody products have a risk of more serious reactions or side effects.

- Anaphylaxis is one type of serious allergic reaction that may happen soon after an antibody is given. This reaction can include difficulty breathing, low blood pressure, hives or rash, and swelling in the mouth and face. This reaction is rare but can be life threatening.
- Serum sickness is a type of allergic reaction that may happen several days to three weeks after a monoclonal antibody is given. This reaction can include hives or rash, fever, enlarged lymph nodes, muscle pains, joint pains, chest discomfort and shortness of breath.
- Some antibody products that contain larger amounts of an additive called sucrose may cause temporary damage to the kidneys. MAb114 contains a relatively smaller amount of sucrose but we will still monitor your kidney function closely by a blood test during this trial.

The study team will monitor you closely for side effects during the infusion, and will have medicine and equipment available to treat side effects, including severe effects, if necessary.

STUDY NUMBER: 18-I-0069

CONTINUATION: Page 6 of 8 pages

Some antibodies that attack human proteins can increase the risk of serious infections. MAb114 is not expected to increase the risk of serious infections because it attacks a virus and not a human protein.

Taking part in this study may affect your eligibility for future monoclonal antibody studies.

**Risks of Blood Drawing and IV Insertion:** The risks of drawing blood from a vein and having an IV include pain, bruising, bleeding, lightheadedness and fainting. Rarely, infection or inflammation can occur in the skin or vein.

**Risks during Pregnancy and Breastfeeding:** We do not know what effects MAb114 may have on a fetus or nursing infant. Therefore, if you are pregnant or nursing you cannot be in this study. Women of childbearing potential must agree to not get pregnant during this study by using an effective method of birth control for the entire study. We will discuss effective birth control methods with you.

You must tell the clinic staff right away if you get pregnant during this study or think that you might be pregnant. If you get pregnant, we may not collect any more blood for research. However, we will still want you to continue with study follow-up visits to check on your health and to tell us the outcome of the pregnancy.

### **POSSIBLE BENEFITS**

This study will not give you any direct health benefit. The information we obtain in this study will help us learn more about the use of MAb114 in humans.

### **COSTS TO YOU FOR PARTICIPATION**

There are no costs to you for taking part in this study. You or your health insurance will have to pay for all medical costs for medical care that you get outside this study.

### **COMPENSATION TO YOU FOR PARTICIPATION**

You will be compensated for your time and inconvenience by the NIH Clinical Research Volunteer Program. It is possible that you may have some expenses that are not covered by the compensation provided.

The compensation is \$375 for the study visit that includes the MAb114 infusion. You will get \$25 total for the timely completion of all 3 days of an electronic diary. You will get \$175 for each scheduled follow-up visit that includes a research blood draw. You will get \$75 for all other clinic visits that do not include research blood draws.

Total compensation for completion of all study visits is about \$3,000 and is based on the number and type of study visits you complete. Your compensation may need to be reported to the internal revenue service (IRS) as taxable income.

### **REASONS FOR STOPPING STUDY PARTICIPATION**

You may choose to stop taking part in the study at any time. If you get MAb114, you will be asked to keep follow-up visits so we can check your health. Collection of samples that are only for research purposes may be stopped.

You may be removed from the study without your consent if the study doctor feels it is in your best interest or if the study is cancelled or stopped early. You may be withdrawn from the study if you cannot continue to attend study visits according to the schedule discussed.

**ALTERNATIVES**

This study is not designed to treat or prevent any disease. You may choose to not take part in this study. You may be eligible for other studies.

**NEW FINDINGS**

We will give you any new information about risks or other information that becomes available that may affect your decision to stay in the study.

**CONFLICT OF INTEREST**

The NIH reviews NIH research staff associated with this study at least yearly for conflicts of interest. You may ask the research team for more information or for a copy of the NIH Guide to Avoiding Financial or Non-Financial Conflicts or Perceived Conflicts of Interest in Clinical Research. This study may have investigators who are not NIH employees. Non-NIH investigators are expected to follow the principles of this Guide but are not required to report their personal financial holdings to the NIH.

The NIH, including some members of the VRC scientific staff, developed MAb114. The results of this study could play a role in whether the FDA approves MAb114 for sale at some time in the future. If approved, the future sale of MAb114 could lead to payments to NIH and some NIH scientists. By U.S. law, government scientists are required to get such payments for their inventions. You will not get any money from the development or sale of MAb114.

**CLINICALTRIALS.GOV**

A description of this clinical trial will be available on <http://www.ClinicalTrials.gov>, as required by U.S. law. This website will not include information that can identify you. At most, the website will include a summary of the results. You can search this website at any time.

**OTHER PERTINENT INFORMATION**

**1. Confidentiality.** When results of an NIH research study are reported in medical journals or at scientific meetings, the people who take part are not named and identified. In most cases, the NIH will not release any information about your research involvement without your written permission. However, if you sign a release of information form, for example, for an insurance company, the NIH will give the insurance company information from your medical record. This information might affect (either favorably or unfavorably) the willingness of the insurance company to sell you insurance.

The Federal Privacy Act protects the confidentiality of your NIH medical records. However, you should know that the Act allows release of some information from your medical record without your permission, for example, if it is required by the Food and Drug Administration (FDA), members of Congress, law enforcement officials, or other authorized people.

**2. Policy Regarding Research-Related Injuries.** The Clinical Center will provide short-term medical care for any injury resulting from your participation in research here. In general, no long-term medical care or financial compensation for research-related injuries will be provided by the NIH, the Clinical Center, or the Federal Government. However, you have the right to pursue legal remedy if you believe that your injury justifies such action.

**3. Payments.** The amount of payment to research volunteers is guided by the NIH policies. In general, patients are not paid for taking part in research studies at the NIH. Reimbursement of travel and subsistence will be offered consistent with NIH guidelines.

**4. Problems or Questions.** If you have any problems or questions about this study or about any research-related injury, contact the Principal Investigator, Martin Gaudinski, MD or the Study Coordinator, Laura Novik, MA, BSN, RN at 301-451-8715.

If you have any questions about your rights as a research subject, you may call the Clinical Center Patient Representative at 301-496-2626.

**5. Consent Document.** Please keep a copy of this document in case you want to read it again.

**PRÉCIS**

**VRC 608:** A Phase I, Open-Label, Dose-Escalation Study of the Safety and Pharmacokinetics of a Human Monoclonal Antibody, VRC-EBOMAB092-00-AB (MAb114), Administered Intravenously to Healthy Adults

**Study**

**Design:** VRC 608 is the first-in-human Phase I study to examine safety, tolerability and pharmacokinetics of the monoclonal antibody (MAb), VRC-EBOMAB092-00-AB (MAb114). MAb114 will be administered as a single dose. The hypotheses are: 1) MAb114 administration to healthy adults will be safe by the intravenous (IV) route; and 2) MAb114 will be detectable in human sera with a definable half-life. The primary objectives are to evaluate the safety and tolerability of MAb114 in healthy adults. Secondary objectives will evaluate the pharmacokinetics of MAb114 and the potential to detect an anti-drug antibody response to MAb114.

**Product**

**Description:** MAb114 is a human IgG1 MAb targeted to the *Zaire ebolavirus* (EBOV) glycoprotein (GP). It was developed by the VRC/NIAID/NIH and manufactured at Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) under current Good Manufacturing Practice (cGMP) regulations. MAb114 is supplied as a lyophilized product in a glass vial at 400 mg per vial with target overfill to 425 mg per vial.

**Subjects:** Up to 30 healthy adults, 18-60 years of age.

**Study Plan:** This is an open-label, dose-escalation study of MAb114 administered by IV infusion at dosages of 5, 25 and 50 mg/kg (Groups 1-3). Enrollment will begin with the lowest dose group. Following the first product administration in each group, the study team will wait at least 3 days before administering MAb114 to a second subject within the same group. Dose-escalation evaluations will occur to ensure the safety data support proceeding to the higher doses. Solicited reactogenicity following product administration will be evaluated using a 3-day diary. Assessment of safety will include clinical observation and monitoring of serum hematological and chemical parameters at defined timepoints throughout the study.

VRC 608 Study Schema		
Group	Subjects	Dose and Route (Day 0)
1	3	5 mg/kg IV
2	5	25 mg/kg IV
3	10	50 mg/kg IV
Total*	18	*A minimum of 18 subjects will be enrolled. Enrollment up to a total of 30 subjects is permitted if additional subjects are necessary for safety or pharmacokinetic (PK) evaluations.

**Study Duration:** Subjects will be followed for 24 weeks after the study product administration.

## 1. INTRODUCTION

Ebolavirus is a large, negative-strand ribonucleic acid (RNA) virus composed of 7 genes encoding viral proteins, including a single glycoprotein (GP) [1-3]. Ebolavirus is one of three genera in the Filoviridae family, which along with Marburgvirus, is known to induce viral hemorrhagic fever. In 2013, the International Committee on the Taxonomy of Viruses (ICTV) Filoviridae Study Group and other experts published an updated taxonomy for filoviruses. Five distinct species in the genus Ebolavirus have been implicated as the etiological agent of Ebolavirus disease (EVD), formerly known as Ebola hemorrhagic fever (EHF) in humans: Bundibugyo (BDBV), Reston (RESTV), Sudan (SUDV), Taï Forest (TAFV), and Zaire (EBOV) [4]. The BDBV, EBOV, and SUDV strains have been associated with large EVD outbreaks in Africa, with reported case fatality rates of up to 90% [5].

Ebolavirus was first described in 1976 near the Ebola River in the Democratic Republic of Congo (DRC). Since 1976, there have been multiple Ebola outbreaks with cases detected in many countries [6]. The largest EVD outbreak occurred in 2014 in West Africa and resulted in over 28,000 reported EVD cases and over 11,000 deaths [7]. EVD cases in persons who traveled from endemic areas were also reported in Italy, Spain, the United States (US) and the United Kingdom (UK) [6]. While the World Health Organization (WHO) declared an end to the EVD public health emergency in March 2016, small outbreaks continue to occur [7]. Given the frequency of international travel, EVD remains a global threat to public health.

Transmission of Ebolavirus to humans is not yet fully understood, but is likely due to incidental exposure to infected animals [8-10], through direct contact with blood, secretions, organs or other bodily fluids of infected people (alive and dead); and through indirect contact with environments contaminated by such fluids [5]. People are infectious for as long as their blood and secretions contain the virus. Men who have recovered from the disease can still transmit the virus through their semen for up to 7 weeks after recovery from illness [5], [11, 12].

EVD has an incubation period of 2 to 21 days (7 days on average, depending on the strain) followed by a rapid onset of non-specific symptoms such as fever, extreme fatigue, gastrointestinal complaints, abdominal pain, anorexia, headache, myalgias and/or arthralgias. These initial symptoms, which last for about 2 to 7 days, are followed by more severe symptoms related to hemorrhagic fever (e.g., hemorrhagic rash, epistaxis, hematuria, hemoptysis, hematemesis, melena, conjunctival hemorrhage, tachypnea, confusion, somnolence, hearing loss, and in some cases, both internal and external bleeding) and accompanied with low white blood cell (WBC) and platelet counts and elevated liver enzymes [5]. These symptoms generally last for about 7 to 14 days. Death can occur 6 to 16 days after the onset of symptoms, manifested by vomiting and diarrhea resulting in dehydration, shock and then multi-organ failure [8, 13].

Immunoglobulin M (IgM) antibodies to the virus appear 2 to 9 days after infection, followed by immunoglobulin G (IgG) antibodies at approximately 17 to 25 days after infection; the latter coinciding with the recovery phase [14]. In survivors of EVD, both humoral and cellular immunity are detected; however, their relative contribution to protection is unknown [14, 15].

Currently, no Food and Drug Administration (FDA)-approved therapies or licensed vaccines exist for any member of Filoviridae family of viruses.

## 1.1 Study Rationale

### 1.1.1 Passive Immunization with an Ebola-specific Antibody: MAb114

The Vaccine Research Center (VRC), National Institute of Allergy and Infectious Diseases (NIAID), National Institutes of Health (NIH) has developed an EBOV neutralizing MAb, VRC-EBOMAB092-00-AB (MAb114), targeted against the Ebolavirus Zaire GP. This MAb was identified from a subject infected with Ebolavirus during the 1995 outbreak in Kikwit, Democratic Republic of Congo, and who maintained circulating antibody for more than 10 years after infection [16]. MAb114 was selected following isolation and screening of a panel of memory B-cells based on its binding to the Ebolavirus GP and *in vitro* neutralization potential [16], [17]. Rhesus macaques passively immunized with MAb114 up to five days post-challenge with a lethal dose of EBOV were protected from EVD, suggesting its potential therapeutic potential in humans with EVD [16]. In earlier reports, cocktails of different MAbs have been tested in non-human primates (NHPs) and in a small number of humans; however, none have been proven to effectively treat EVD [18, 19].

The 2014 outbreak underscored the importance of a therapeutic strategy for populations when widespread vaccination coverage is not available or feasible such as when there are limited public health resources. Based on its *in vitro* activity and previous experience with other MAbs against EVD, the rationale for development of MAb114 is to provide a simplified therapeutic product and/or dosing regimen for EVD, identify mechanism(s) of EVD protection and explore development for potential stockpiling [20].

This Phase I study, VRC 608, is primarily directed at evaluation of the safety and pharmacokinetics of MAb114, which may provide therapeutic benefit with a single infusion in cases of EBOV exposure/infection.

### 1.1.2 Rationale for Dose and Administration Route Selection

Preclinical data in the NHP animal model informed the doses of MAb114 (5-50 mg/kg) that will be evaluated. In the GLP toxicity study, MAb114 doses ranging from 50 to 500 mg/kg/ week were well-tolerated, with MAb114 demonstrating linear kinetics and a 7-15-day half-life. Preliminary evidence in a NHP model of EVD showed a 50 mg/kg dose of MAb114 was protective to NHPs when administered up to five days post-EBOV challenge [16]. Moreover, a 25 mg/kg dose is important to explore because PK data on a 25mg/kg dose is valuable should future, planned dose-down studies in an NHP dose-down lethal challenge establish protection.

In an epidemic situation, application of effective protection measures against EBOV infection is urgent for exposed individuals. MAb114 will be administered by IV infusion to accelerate delivery as passive immunization studies with other MAbs developed by the VRC has shown antibody concentration peaks within hours after IV administration [21].

Refer to the Investigator's Brochure (IB) for more information on these proof-of-concept preclinical studies.

## 1.2 MAb114 Specific Research Laboratory Assessments

Research assays designed to characterize the investigational product rather than assess the health of the subjects are described below.

Research laboratory assessments in this Phase I study will include:

- MAb114 PK determinations as measured by enzyme-linked immunosorbent assay (ELISA),
- Detection of anti-drug antibody (ADA) to MAb114,
- Measurement of EBOV envelope GP-specific binding antibody by ELISA, and
- Ex vivo neutralization potential of MAb114 post-infusion as an exploratory evaluation.

De-identified stored samples may also be used later to further evaluate pharmacokinetics and to elucidate genetic factors associated with MAb114 pharmacokinetics.

Testing will be performed at the Vaccine Immunology Testing Laboratory (VITL) (known formerly as the NIAID Vaccine Immune T-Cell and Antibody Laboratory or NVITAL), in research laboratories at the VRC, Laboratory of Immunology, Biodefense Research Section, NIAID, NIH or by other approved collaborators.

### 1.3 Preclinical Toxicology Study of VRC-EBOMAB092-00-AB (MAb114)

A 4-week repeat dose intravenous toxicity study of MAb114 in male and female rhesus monkeys was performed by CiToxLAB North America (Québec, Canada) in accordance with Good Laboratory Practice (GLP) regulations. Treatment with IV-administered MAb114 at doses of 50 mg/kg once weekly, 50 mg/kg three times per week, and 500 mg/kg once weekly resulted in detectable concentrations of MAb114 at the end of the 8-week recovery period. There were no MAb114-related mortalities, clinical signs, or changes in body weight parameters following either one or three times weekly slow bolus IV infusions of MAb114 at 50 mg/kg (50 and 150 mg/kg/week, respectively) or weekly IV infusion of MAb114 at 0 or 500 mg/kg (500 mg/kg/week).

There were no MAb114-related effects on safety pharmacology parameters and no MAb114-related findings in eye exams. Hematology, coagulation and urinalysis parameters were not impacted by the MAb114 treatment. Clinical chemistry evaluations revealed non-adverse MAb114-related increases in serum globulins and total proteins with a secondary reduction in A/G ratio in individual animals, mainly in monkeys administered 500 mg/kg/week at Day 25. These findings were considered secondary to the administration of a high dose of a human immunoglobulin and were generally reversible upon cessation of dosing.

Details on preclinical studies conducted with MAb114 can be found in the IB.

### 1.4 *In Vitro* Safety Studies

The list of *in vitro* preclinical safety studies performed to assess potential off target binding of MAb114 are summarized in **Table 1**. Refer to the IB for more information about these studies.

**Table 1: *In Vitro* Preclinical Safety Studies**

Study Purpose	Study Outcome
Assessment of anti-phospholipid reactivity	MAB114 does not react to phospholipids.
Assessment of binding to a human epithelial cell line (HEp-2) by Immunohistochemistry	MAB114 does not bind to HEp-2 cells.
Assessment of potential “off target” binding in a GLP tissue cross-reactivity study with normal adult human tissues	To determine the potential cross reactivity of MAB114 binding, varying concentrations of MAB114 (1 and 10 mcg/mL) were applied to cryosections from a full panel of normal human adult tissues. Specific MAB114 staining was not observed in any tissue evaluated. The cytoplasmic or extracellular staining observed in multiple tissue elements was also noted on control slides and thus attributed to the secondary antibody. Overall, <i>in vitro</i> tissue cross-reactivity evaluations failed to identify potential tissue sites or organ systems for MAB114 binding in humans.

**1.5 Non-Human Primate (NHP) Studies of VRC-EBOMAB092-00-AB (MAb114)**

Non-GLP studies of MAB114 have been completed in NHPs to assess for preclinical evidence of potential efficacy for treatment of EVD. **Table 2** summarizes the studies performed and supports the plan to evaluate up to 50 mg/kg dose administered IV as a dose range of potential interest for a therapeutic indication.

**Table 2: Preclinical proof-of-concept studies performed with MAB114 in NHP**

Study Purpose	Study Outcome
Demonstration of protection with 3 doses of MAB114 administered at 3 different timepoints 24 hours apart starting one day after challenge with lethal dose of EBOV in female rhesus macaques	100% (3/3) of the female rhesus macaques infected with EBOV were protected from mortality when dosed with a 50 mg/kg IV dose of MAB114 administered 24, 48 and 72 hours post-challenge with EBOV. Control animal succumbed. [16]
Demonstration of protection with 3 doses of MAB114 administered at 3 different timepoints 24 hours apart starting five days after challenge with lethal dose of EBOV in female rhesus macaques	100% (3/3) of the female rhesus macaques infected with EBOV were protected from mortality when dosed with a 50 mg/kg IV dose of MAB114 administered 120, 144 and 168 hours post-challenge with EBOV. Control animal succumbed. [16]
Demonstration of protection with a single dose of MAB114 administered five days after challenge with lethal dose of EBOV in female rhesus macaques.	100% protection (3/3) from mortality demonstrated for a single 50 mg/kg dose administered IV five days post-challenge with EBOV. Control animal succumbed [data not published].
Demonstration of protection with a single dose of MAB114 administered five days after challenge with lethal dose of EBOV in female rhesus macaques.	100% protection (3/3) from challenge demonstrated for a single 30 mg/kg dose administered IV five days post-challenge with EBOV. Control animal succumbed [data not published].

## 1.6 Previous Human Experience

### 1.6.1 Human Experience with MAb114

As of 7/24/2018, 13 subjects have been enrolled and received one dose of MAb114 administered IV: 3 subjects received 5 mg/kg, 5 subjects received 25 mg/kg, and 5 subjects received 50 mg/kg. Overall, 13 product administrations have been completed.

There have been no serious adverse events (SAEs). Overall, 2 of 13 subjects (15.4%) have had one or more unsolicited adverse events (AEs) reported, with maximum severity being Grade 1 for 1 subject and Grade 2 for 1 subject, and all assessed as not related to the study product.

Product administrations have been well tolerated. No systemic or local reactogenicity symptoms were reported during the 30-minute MAb114 infusions.

Overall, 13 subjects completed diary cards. There were no reported or observed solicited local reactions in the 7 days after product administration. Regarding solicited systemic events, 3 of 11 subjects (23.1%) reported one or more mild systemic signs or symptoms in the 3 days after IV product administration. This included mild symptoms of malaise (n=2), myalgia (n=2), headache (n=3), chills (n=2), nausea (n=2), and joint pain (n=2).

### 1.6.2 Human Experience with Other Ebola-Specific Antibodies

Development and limited testing of other therapeutic MABs indicated that these MABs may have an acceptable safety profile in EVD-infected humans [18]. The triple monoclonal antibody product, ZMapp™, was administered to infected individuals during the recent 2014 outbreak demonstrating that MABs have been tested in the treatment of EVD. Although efficacy was not demonstrated, the product was shown to be safe [19].

Recently data has been published on a new, co-formulated cocktail of three MABs, REGN3470-3471-3479, targeting three non-overlapping epitopes on Ebolavirus glycoprotein. The product was developed by the Regeneron Pharmaceuticals, Tarrytown, NY, and was shown to be safe and well tolerated in a Phase 1 study in healthy adults [22].

## 2. STUDY PRODUCT

The study product, VRC-EBOMAB092-00-AB (MAb114) was developed by the VRC, NIAID, NIH (Bethesda, MD) and manufactured under cGMP by Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) operating under contract by MedImmune LLC (Gaithersburg, MD). MAb114 is a human IgG1 MAB targeted against the glycan cap and core domains in the GP1 subunit of *Zaire* EBOV GP [16].

The study product was produced using recombinant DNA technology. Following identification of the MAb114 memory B cell clone, heavy and light chain sequences were obtained by PCR amplification and DNA sequencing. Heavy and light chain sequences were cloned into an expression vector at Cellca GmbH (Laupheim, Germany). This expression vector was used to generate a stably transfected Chinese Hamster Ovary (CHO) DG44 cell line for use in cGMP manufacture.

The bulk lot of the drug substance was manufactured at Cook Pharmica LLC d.b.a. Catalent Indiana, LLC (Bloomington, IN) by purifying antibody produced from the stably transfected DG44 cell line. The drug substance was formulated, sterilized by membrane filtration, filled into glass vials, and lyophilized. The lyophilized product contains 400 mg of drug substance per vial with

target overfill to 425 mg per vial. Filled vials were transferred to the Vaccine Clinical Materials Program (VCMP), Leidos Biomedical Research, Inc. (Frederick, MD) for labeling. Vials are reconstituted prior to use. Reconstitution will involve addition of sterile water for injection (SWFI). The reconstituted product will nominally contain a 50 mg/mL concentration of MAb114 in 20 mM Histidine/Histidine HCl, 240 mM Sucrose, 0.02% Polysorbate 80, at pH 6.0. Vials are intended for single-use only and thus do not contain a preservative.

Details on MAb114 composition and manufacturing are provided in the IB. Quality Assurance (QA) lot release testing by the manufacturer and ongoing stability programs verify conformance to product specifications throughout trial conduct.

### 3. STUDY OBJECTIVES

#### 3.1 Primary Objectives

- To evaluate the safety and tolerability of MAb114 administered as a single dose at 5 mg/kg IV to healthy adults.
- To evaluate the safety and tolerability of MAb114 administered as a single dose at 25 mg/kg IV to healthy adults.
- To evaluate the safety and tolerability of MAb114 administered as a single dose at 50 mg/kg IV to healthy adults.

#### 3.2 Secondary Objectives

- To evaluate the pharmacokinetics of MAb114 at each dose level at representative timepoints throughout the study.
- To determine whether anti-drug antibody to MAb114 can be detected in recipients of MAb114.

#### 3.3 Exploratory Objectives

- To evaluate for evidence of GP-binding activity of MAb114 in samples collected at representative timepoints throughout the study.
- To evaluate for evidence of functional neutralization activity of MAb114 in samples collected at representative timepoints throughout the study.
- Genetic factors associated with MAb114 pharmacokinetics may also be evaluated.

### 4. STUDY DESIGN

This is an open-label, dose-escalation study to examine the safety, tolerability, and PK of MAb114 in healthy adults. The primary hypothesis is that MAb114 administration will be safe by the IV route. The secondary hypothesis is that MAb114 will be detectable in human sera with a definable half-life. The study schema is shown in **Table 3**.

**Table 3: VRC 608 Study Schema**

Group	Subjects	Administration Schedule
		Day 0
1	3	5 mg/kg IV
2	5	25 mg/kg IV
3	10	50 mg/kg IV
Total*	18	*A minimum of 18 subjects will be enrolled. Enrollment up to a total of 30 subjects is permitted if additional subjects are necessary for safety or PK evaluations.

Enrollment will begin in the 5 mg/kg IV dose group (Group 1). Following the first product administration for each group, the study team will wait at least 3 days before administering MAb114 to additional subjects within that group. Dose escalation and subject enrollment into Groups 2 and 3 may proceed after interim safety reviews for the lower dose group as described in Section 4.3.

Safety review decisions and the status of the enrollment process will be presented to the Protocol Safety Review Team (PSRT) throughout the trial and discussed during the safety review meetings as described in Section 8.8.

Subjects will be expected to be available for follow-up visits during the 24 weeks of study participation. Safety laboratory and PK samples will be collected at specified intervals throughout the study as per the Schedule of Evaluations. Subjects will keep a daily diary of solicited systemic symptoms for 3 days after study product administration.

The study will be conducted by the VRC Clinical Trials Program (CTP) at the Vaccine Evaluation Clinic, NIH Clinical Center (NIH CC).

**4.1 Study Population**

All inclusion and exclusion criteria must be evaluated for eligibility.

**4.1.1 Inclusion Criteria**

*A volunteer must meet all of the following criteria:*

1. Able and willing to complete the informed consent process.
2. Available for clinical follow-up through the last study visit.
3. 18 to 60 years of age.
4. In good general health without clinically significant medical history.
5. Willing to have blood samples collected, stored indefinitely, and used for research purposes.
6. Able to provide proof of identity to the satisfaction of the study clinician completing the enrollment process.
7. Physical examination without clinically significant findings within the 84 days prior to enrollment.
8. Have screening laboratory values within 84 days prior to enrollment that meet the following criteria:
  - WBC 2,500-12,000/mm<sup>3</sup>

- WBC differential either within institutional normal range or accompanied by the Principal Investigator (PI) or designee approval
- Platelets = 125,000 – 400,000/mm<sup>3</sup>
- Hemoglobin within institutional normal range or accompanied by the PI or designee approval
- Creatinine  $\leq 1.1$  x upper limit of normal (ULN)
- ALT  $\leq 1.25$  x ULN
- Negative for human immunodeficiency virus (HIV) infection by a Food and Drug Administration (FDA) approved method of detection
- Negative for Hepatitis B core antibody (HBcAb) and Hepatitis C virus antibody (HCV Ab)

***Criteria applicable to women of childbearing potential:***

9. If a woman is of reproductive potential and sexually active with a male partner, then she agrees to use an effective means of birth control from the time of study enrollment until the last study visit, or to be monogamous with a partner who has had a vasectomy.
10. Negative human chorionic gonadotropin ( $\beta$ -HCG) pregnancy test (urine or serum) on day of enrollment and product administration.

**4.1.2 Exclusion Criteria**

***A volunteer will be excluded from study participation if one or more of the following conditions apply:***

1. Previous receipt of a licensed or investigational monoclonal antibody or Ebola vaccine.
2. Weight >100 kg.
3. Any history of a severe allergic reaction with generalized urticaria, angioedema or anaphylaxis prior to enrollment that has a reasonable risk of recurrence during the study.
4. Hypertension that is not well controlled.
5. Woman who is breast-feeding or planning to become pregnant during study participation.
6. Receipt of any investigational study product within 28 days prior to enrollment.
7. Any other chronic or clinically significant medical condition that in the opinion of the investigator would jeopardize the safety or rights of the volunteer, including but not limited to: diabetes mellitus type I, chronic hepatitis; OR clinically significant forms of: drug or alcohol abuse, asthma, autoimmune disease, psychiatric disorders, heart disease, or cancer.
8. Bleeding disorder diagnosed by a doctor (e.g. factor deficiency, coagulopathy, or platelet disorder requiring special precautions) or significant bruising or bleeding difficulties with IM injections or blood draws.
9. Use of angiotensin-converting enzyme (ACE) inhibitors or other potential nephrotoxins.

## 4.2 Clinical Procedures and Laboratory Assays

Safety evaluations will include laboratory studies, medical history, and physical assessment by clinicians. The study schedule is provided in Appendix III. Total blood volume drawn from each subject will comply with the NIH CC Guidelines available on the NIH intranet at the following link: <http://cc-internal.cc.nih.gov/policies/PDF/M95-9.pdf>.

### 4.2.1 Screening

Screening for this study will be completed through the VRC's screening protocol, VRC 500 (NIH 11-I-0164); no screening evaluations will be performed within this protocol. Volunteers will be recruited through Institutional Review Board (IRB)-approved advertising.

The evaluations and sample collection that will be included in screening are a medical history, physical exam, any laboratory tests needed to confirm eligibility, and pregnancy test for females of reproductive potential. The screening evaluations are outlined in Appendix III. Additional assessments of health may be conducted at screening based on clinical judgment. Only subjects determined to be eligible after screening is completed will be enrolled. Research samples of peripheral blood mononuclear cells (PBMCs), plasma and serum will also be collected. VRC 608 informed consent documents will be reviewed. Counseling related to potential risks of the study product and pregnancy prevention will be performed. An Assessment of Understanding (AoU) will be completed in association with enrollment into VRC 608. Records will be maintained that document the reason(s) why a screened individual was not enrolled.

### 4.2.2 Enrollment, Study Days and Visit Numbers

Clinicians must discuss the target dates and timing of the study product administration and sample collections before completing each enrollment to help ensure that the subjects can comply with the projected schedule. In this study, enrollment is defined as the assignment of a study identification number and study group schedule in the clinical database. Informed consent must be obtained prior to enrollment. Enrollment may occur on the same day as product administration at Visit 02 (Day 0) or in advance of product administration at Visit 01R (Day -28 to Day 0).

Visit 02 (Day 0) is defined as the day of MAb114 administration. Day 0 is preferably conducted within 14 days after enrollment but may occur up to 28 days after enrollment if needed. This period may be increased with PI approval.

For calculating elapsed days following Day 0, each subsequent calendar date is labeled by the next sequential "Study Day" as shown in the Schedule of Evaluations, Appendix III. Since there may be more than one research sampling timepoint of interest per study day, each sample collection timepoint has its own "Visit Number." For this reason, there may be more than one visit number recorded on the same calendar date.

Medical history and Day 0 evaluations prior to the study product administration are the baseline for subsequent safety assessments.

### 4.2.3 Administration of MAb114

All study product administrations will be completed according to the group assignment. For women of childbearing potential, study product administration may not proceed unless a negative pregnancy test has been obtained. Prior to study product administration, temperature, blood

pressure, heart rate (pulse) and weight will be collected, and a targeted physical examination will be conducted.

In all study groups, the subject will be observed for at least 4 hours following completion of product administration. Following the first product administration for each group, the study team will wait at least 3 days before administering MAb114 to additional subjects within that group.

On Day 0, an IV access will be established in an arm vein using aseptic technique. A different site may be used for collection of PK blood samples; however, the same site may be used after flushing the line if another site is not available. MAb114 will be diluted with normal saline and infused over a period of approximately 30 minutes; longer infusion times will be permitted. Infusion should continue until the bag is empty. If the subject experiences side effects during the infusion, the rate of infusion may be slowed or stopped to alleviate the symptoms.

Procedures for MAb114 preparation and administration are described in Section 7.

#### **4.2.4 Solicited Adverse Events and Clinical Follow-up**

Subjects will be asked to record temperature and systemic symptoms daily for 3 days after the study product administration. Subjects will be trained and encouraged to use the electronic database to record reactogenicity but will have the option to use a paper diary card. When the 3-day diary parameters are recorded directly by the subject into the database, the subject's electronic record will be available to clinicians in real time and will be the source for these data. If concerns arise based on the subject's report of symptoms, clinicians may follow up with additional phone calls during the reactogenicity period as needed. The paper diary will be the source document, if used by the subject. When neither a paper nor electronic diary is available from the subject, the clinician will note the source of reactogenicity information recorded in the study database.

For this study, solicited systemic parameters occurring during the 3 days after receipt of study product will include: unusually tired/feeling unwell, muscles aches, headache, chills, nausea and joint pain. Subjects will also record highest measured temperature daily. Subject diaries are reviewed for accuracy and completeness at follow-up visits and reactogenicity is recorded without an attribution assessment. Clinicians will follow and collect resolution information for any reactogenicity symptoms that are not resolved within 3 days.

Local symptoms will be assessed and recorded by the clinicians. Local reactogenicity parameters will include pain/tenderness, swelling, redness, bruising, and pruritus (itchiness) at the product administration site. Clinicians will assess the study product administration site(s) for local reactogenicity on the day of product administration after completion of the administration and during the scheduled follow-up time points as noted in the Schedule of Evaluations (Appendix III).

Events that may require a clinic visit include rash, urticaria, fever of 38.6°C (Grade 2) or higher lasting greater than 24 hours or significant impairment in the activities of daily living (such as those consistent with Grade 2 or higher impairment). Additionally, arthralgia or other clinical concerns may prompt a study visit based on the judgment of a study clinician.

Clinical laboratory assays and clinical evaluations will assess for safety and tolerability at specified intervals post study product administration. Any new or concerning symptoms will be fully assessed to include specialty consultation at the NIH CC as clinically indicated.

#### 4.2.5 Pharmacokinetics

PK samples will be collected as close as reasonably possible to the target timepoints. Because the time of blood collection is critical for PK analysis, the actual time of the phlebotomy will be recorded for all samples. The PK target timepoints are defined in the Schedule of Evaluations (Appendix III).

#### 4.2.6 Schedule of Evaluations

The Schedule of Evaluations (Appendix III) provides details on the study schedule and the permitted visit windows. After enrollment, deviations from the visit windows are discouraged but will be permitted at the discretion of the PI or designee and will be recorded as protocol deviations.

Additional visits and blood draws may be scheduled during the study if needed to assess subject safety or for sample collection in support of immunological testing provided the cumulative blood collection volume complies with NIH CC guidelines. After study completion, subjects may be invited to participate in one of the VRC sample collection protocols (VRC 200 or VRC 900) for follow-up sample collection.

Any evaluation for an adverse event (AE) or possible exacerbation of a pre-existing condition may be scheduled at the study team's discretion as a "protocol-related" evaluation.

#### 4.2.7 Concomitant Medications

Only routine prescription and over the counter medications, and herbal supplements, will be entered in the database at the time of enrollment. Subsequently, concomitant medications associated with an AE that requires expedited reporting or the development of a new chronic condition requiring ongoing medical management will be recorded in the database. Otherwise, concomitant medications taken throughout the study will be recorded in the subject's chart as needed for general medical documentation but will not be recorded in the study database.

#### 4.3 Criteria for Dose Escalation

There are two dose escalation reviews in this study. The PSRT (Section 8.8) will conduct an interim safety data review before the dose escalation may occur. The PSRT must assess the data as showing no significant safety concerns before proceeding with enrollment of each subsequent group.

- The first dose escalation review (from 5 mg/kg IV to 25 mg/kg IV) will occur when all 3 subjects who received the 5 mg/kg IV dose have completed Visit 05, the Day 7 safety follow-up visit. The PSRT review will determine whether enrollment into Group 2 may begin.
- The second dose escalation review (from 25 mg/kg IV to 50 mg/kg IV) will occur when all 5 subjects who received the 25 mg/kg IV dose have completed Visit 05, the Day 7 safety follow-up visit. The PSRT review will determine whether enrollment into Group 3 may begin.

If there are discontinuations from the study before there are sufficient data to conduct the dose continuation review for a specific group, then extra subjects may be enrolled into that group to obtain the requisite data on at least 3 (Group 1) or 5 (Group 2) subjects. Additionally, AEs assessed as related to study product at the time of a dose escalation review may warrant enrollment of additional subjects into a dose group to reassess safety before proceeding to a higher dose.

Consultation with the IRB and FDA, if needed, as per study pause criteria (Section 4.5) will occur if indicated by the review. The IRB will be provided with documentation of the safety review process and notification of the dose escalation.

#### 4.4 Criteria for Discontinuing Study Participation

A subject may be discontinued from study participation for the following reasons:

1. Subject decides to discontinue participation;
2. Subject develops a medical condition that is a contraindication to continuing study participation;
3. The IND sponsor or regulatory authority stops the study;
4. The PI (or designee) assesses that it is not in the best interest of the subject to continue participation in the study or that the subject's compliance with the study is not sufficient.

#### 4.5 Criteria for Pausing the Study and Resuming the Study

Administration of the study product and new enrollments will be paused by the PI according to the criteria noted below. In the event of a pause, the IND Sponsor Medical Officer (MO) and the PSRT will be promptly notified. Pause criteria are as follows:

- **One** (or more) subject experiences a **Serious Adverse Event (SAE)** that is assessed as related to study product, or
- **Two** (or more) subjects experience the same **Grade 3 or higher AEs** assessed as related to study product (other than self-limited Grade 3 solicited reactogenicity AEs).

#### **Plan for Review of Pauses and Resuming Rules:**

Study product administration and enrollments would resume only if review of the AEs that caused the pause results in a recommendation to permit further study product administrations and study enrollments. The reviews to make this decision will occur as follows:

- **Pauses for related SAEs:** The IND Sponsor, with participation by the PI, will conduct the review and make the decision to resume, amend or close the study and will notify the FDA and IRB accordingly.
- **Pauses for Grade 3 or higher related AEs:** The IND Sponsor MO, in consultation with the PI, will conduct the review and make the decision to resume, amend or close the study for the Grade 3 or higher AEs that meet criteria for pausing the study. As part of the pause review, the reviewers will also advise on whether the study needs to be paused again for any subsequent events of the same type. The FDA and the IRB will be notified of Grade 3 or higher pause reviews and of the IND Sponsor's decisions.

## 5. SAFETY AND ADVERSE EVENT REPORTING

### 5.1 Adverse Events

An AE is any untoward or unfavorable medical occurrence in a human subject, including any abnormal sign (e.g., abnormal physical exam or laboratory finding), symptom, or disease temporally associated with the use of study treatment, whether considered related to the study treatment.

AEs will be graded according to the *DAIDS Table for Grading the Severity of Adult and Pediatric Adverse Events* (see Appendix IV).

Reporting of all AEs will occur during the period from study product administration at Day 0 through 28 days after study product administration. From Day 28 through completion of study participation, only SAEs and new chronic medical conditions that require ongoing medical management will be recorded as AEs in the study database.

### 5.2 Serious Adverse Events

An SAE is defined in 21 CFR 312.32 as follows: “An adverse event or suspected adverse reaction is considered serious if, in the view of either the investigator or the sponsor, it results in any of the following outcomes: Death, a life-threatening adverse event, inpatient hospitalization or prolongation of existing hospitalization, a persistent or significant incapacity or substantial disruption of the ability to conduct normal life functions, or a congenital anomaly/birth defect. Important medical events that may not result in death, be life-threatening, or require hospitalization may be considered serious when, based upon appropriate medical judgment, they may jeopardize the patient or subject and may require medical or surgical intervention to prevent one of the outcomes listed in this definition. Examples of such medical events include allergic bronchospasm requiring intensive treatment in an emergency room or at home, blood dyscrasias or convulsions that do not result in inpatient hospitalization, or the development of drug dependency or drug abuse.”

“Life-threatening” refers to an AE that at occurrence represents an immediate risk of death to a subject. An event that may cause death if it occurs in a more severe form is not considered life-threatening. Similarly, a hospital admission for an elective procedure is not considered a SAE.

### 5.3 Adverse Event Reporting to the IND Sponsor

AEs that meet SAE Reporting Requirements must be reported and submitted by the clinical site on an expedited basis to the IND Sponsor, VRC/NIAID/NIH, according to Sponsor guidelines as follows:

- results in death
- is life threatening
- results in persistent or significant disability/incapacity
- requires unplanned inpatient hospitalization or prolongation of existing hospitalization
- is a congenital anomaly/birth defect in the offspring of a study subject
- is an important medical event that may jeopardize the subject or may require intervention to prevent one of the other outcomes listed above.

In addition, any event, regardless of severity, which in the judgment of an investigator represents a SAE, may be reported on an expedited basis.

An investigator will communicate an initial SAE report within 24 hours of site awareness of occurrence to the IND sponsor by email to the VRC Protocol Operations Office (see Appendix II).

A written report by the investigator should be submitted to the IND Sponsor within 3 working days. In order for the IND Sponsor to comply with regulations mandating sponsor notification of specified SAEs to the FDA within 7 and/or 15 calendar days, the investigator must submit additional information as soon as it is available.

### 5.3.1 IND Sponsor Reporting to the FDA

It is the responsibility of the IND Sponsor to make the determination of which SAEs are “serious and unexpected suspected adverse reactions” (SUSARs) as defined in 21 CFR 312.32.

- *Suspected adverse reaction* means any AE for which there is a reasonable possibility that the drug caused the AE.
- *Unexpected adverse event* means an AE that is not listed in the IB or is not listed at the specificity or severity that has been observed.

All SUSARs, as determined by the IND Sponsor, will be reported to the FDA as IND Safety Reports and IND Safety Reports will be provided to the IRB.

The IND Sponsor will also submit an IND Annual Report of the progress of the investigation to the FDA as defined in 21 CFR 312.33.

## 5.4 Reporting to the Institutional Review Board

### 5.4.1 Unanticipated Problem (UP) Definition

An Unanticipated Problem (UP) is defined as any incident, experience, or outcome that meets all three of the following criteria:

- unexpected in nature, severity, or frequency in relation to the research risks that are described in the protocol, informed consent, IB, other study documents or in consideration of the characteristics of the subject population being studied; **and**
- related to participation in the research; **and**
- suggests that the research places subjects or others at a greater risk of harm (including physical, psychological, economic, or social harm) than was previously known or recognized.

Serious UP: An UP that meets the definition of a SAE or compromises the safety, welfare or rights of subjects or others.

An UP that is not an Adverse Event (UPnonAE) is an unanticipated problem that does not fit the definition of an AE, but which may, in the opinion of the investigator, involve risk to the subject, affect others in the research study, or significantly impact the integrity of research data. Such events would be considered a non-serious UP. For example, we will report occurrences of breaches of confidentiality, accidental destruction of study records or samples, or unaccounted-for study drug.

### 5.4.2 Protocol Deviation Definition

A Protocol Deviation is defined as any change, divergence, or departure from the IRB-approved study procedures in a research protocol. Protocol deviations are designated as serious or non-serious and further characterized as follows:

- Those that occur because a member of the research team deviates from the protocol.
- Those that are identified before they occur but cannot be prevented.
- Those that are discovered after they occur.

Serious Protocol Deviation: A deviation that meets the definition of a SAE or compromises the safety, integrity of the data, welfare or rights of subjects or others.

### 5.4.3 Non-Compliance Definition

Non-compliance is the failure to comply with applicable NIH Human Research Protections Program (HRPP) policies, IRB requirements, or regulatory requirements for the protection of human subjects. Non-compliance is further characterized as serious, continuing or minor.

“Serious non-compliance” is defined as non-compliance that:

- Increases risks, or causes harm, to subjects
- Decreases potential benefits to subjects
- Compromises the integrity of the NIH-HRPP
- Invalidates the study data

“Continuing non-compliance” is non-compliance that is recurring.

“Minor non-compliance” is non-compliance that is neither serious nor continuing.

### 5.4.4 Expedited Reporting to the IRB

The following will be reported to the NIAID IRB within 7 calendar days of investigator awareness:

- Serious and non-serious UP
- Deaths
- Serious protocol deviations
- Serious or continuing non-compliance
- SAEs that are possibly, probably, or definitely related to the research regardless of expectedness

The following waiver applies to reporting anticipated protocol deviations and expected UPnonAEs: Anticipated deviations in the conduct of the protocol will not be reported to the IRB unless they occur at a rate greater than anticipated by the study team. Expected AEs will not be reported to the IRB unless they occur at a rate greater than that known to occur in healthy adults. If the rate of these events exceeds the rate expected by the study team, the events will be classified and reported as though they are unanticipated problems.

### 5.4.5 Annual Reporting to the IRB

The following will be reported to the NIAID IRB in summary at the time of Continuing Review:

- Serious and non-serious UPs
- Expected SAEs that are possibly, probably, or definitely related to the research
- SAEs that are not related to the research
- All AEs, except expected AEs granted a waiver of reporting
- Serious and non-serious Protocol Deviations
- Serious, continuing, and minor non-compliance
- Any trends or events which in the opinion of the investigator should be reported

## 6. STATISTICAL CONSIDERATIONS

### 6.1 Overview

This is a Phase I, open-label, dose-escalation study of the safety and pharmacokinetics of a human monoclonal antibody, MAb114, administered intravenously to healthy adults.

### 6.2 Objectives

The primary objectives of the study are to evaluate the safety and tolerability of MAb114, to evaluate the pharmacokinetics of MAb114, and to estimate the half-life of MAb114 in serum.

### 6.3 Size and Accrual

#### 6.3.1 Sample Size Considerations

This study is primarily descriptive. For safety analysis, the goal is to identify safety concerns associated with different MAb114 dosages. There may be as few as 3 to 10 subjects in a group; therefore, this section considers group sizes of  $n=3$ , 5 and 10.

The ability to identify serious adverse experiences is best expressed by the maximum true rate of SAE that would unlikely be observed and the minimum true SAE rate that would very likely be observed. Within a group of size  $n=3$ , there is an 80% chance of observing at least 1 event if the true rate is no less than 0.42 and a 90% chance of observing no event if the true rate is no bigger than 0.035. Within a group of size  $n=10$ , there is at least an 80% chance of observing at least 1 event if the true rate is no less than 0.15 and at least a 90% chance of observing no event if the true rate is no bigger than 0.1.

Probabilities of observing 0 or more than 1 event are presented in **Table 4** for a range of possible true event rates. These calculations provide a complete picture of the sensitivity of this study design to identify potential safety problems with the study agent. For example, within the group of size  $n=3$ , if the true event rate is 0.1, then there is a 73% probability of observing no event and a 2.8% probability of observing more than 1 event; while, within the group of size  $n=10$ , if the true event rate is 0.1, then there is a 35% probability of observing no event and an 26% probability of observing more than 1 event.

**Table 4: Probability of Event for Different Scenarios**

True event rate	Within a group (n=3)		Within a group (n=5)		Within a group (n=10)	
	Pr (0 event observed)	Pr (more than 1 event observed)	Pr (0 event observed)	Pr (more than 1 event observed)	Pr (0 event observed)	Pr (more than 1 event observed)
0.05	0.857	0.007	0.774	0.023	0.599	0.086
0.1	0.729	0.028	0.590	0.081	0.349	0.264
0.2	0.512	0.104	0.328	0.263	0.107	0.624
0.3	0.343	0.216	0.168	0.472	0.028	0.851
0.4	0.216	0.352	0.078	0.663	0.006	0.954

**Table 5** gives the upper and lower bounds for 95% exact binomial confidence intervals (CIs) for all possible number of observed events within a group. Within the group of size n=3, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has an upper bound of 0.708; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.292. Within the group of size n=5, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has upper bound of 0.522; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.478. Within the group of size n=10, if no subjects experience the event, the 95% exact 2-sided CI for the true rate has upper bound of 0.308; if all subjects experience the event, the 95% exact 2-sided CI for the true rate has a lower bound of 0.692.

**Table 5: 95% Confidence Intervals of the True Rate for All Possible Number of Observed Events Within a Group**

Within a group (n=3)		Within a group (n=5)		Within a group (n=10)	
Observed rate	95% CI	Observed rate	95% CI	Observed rate	95% CI
0/3	0, 0.708	0/5	0, 0.522	0/10	0, 0.308
1/3	0.008, 0.906	1/5	0.005, 0.716	1/10	0.002, 0.445
2/3	0.94, 0.992	2/5	0.053, 0.853	2/10	0.025, 0.566
3/3	0.292, 1	3/5	0.147, 0.947	3/10	0.067, 0.652
		4/5	0.284, 0.995	4/10	0.122, 0.738
		5/5	0.478, 1	5/10	0.187, 0.813
				6/10	0.262, 0.878
				7/10	0.348, 0.933
				8/10	0.444, 0.975
				9/10	0.555, 0.997
				10/10	0.692, 1

Tables 4 and 5 also apply to the secondary and exploratory objectives.

**6.4 Statistical Analysis**

**6.4.1 Analysis Variables**

The analysis variables consist of baseline, pharmacokinetic, and safety variables for the primary and secondary objective analyses.

**6.4.2 Baseline Demographics**

Baseline characteristics including demographics and laboratory measurements will be summarized using descriptive statistics.

**6.4.3 Safety Analysis**

Summaries of the number and percentage of subjects experiencing any AE or reactogenicity will be tallied by group and presented along with exact 95% confidence intervals for the proportion.

Solicited Adverse Events:

Solicited AE data is collected after each dose administered in this study. The number and percentage of subjects experiencing each type of solicited sign or symptom will be tabulated by severity. For a given sign or symptom, each subject’s solicited AEs will be counted once under the maximum severity for all assessments.

### Adverse Events:

Unsolicited AEs are coded into Medical Dictionary for Regulatory Activities (MedDRA) preferred terms. The number and percentages of subjects experiencing each specific AE will be tabulated by severity and relationship to treatment. For the calculations in these tables, each subject's adverse experience will be counted once under the maximum severity or strongest recorded causal relationship to treatment.

A complete listing of adverse experiences for each subject will provide details including severity, relationship to treatment type, onset, duration and outcome.

### Local laboratory values:

Boxplots of local laboratory values will be generated for baseline values and for values measured during the course of the study. Each boxplot will show the 1<sup>st</sup> quartile, the median, and the 3<sup>rd</sup> quartile. Outliers, or values outside the boxplot, will also be plotted. If appropriate, horizontal lines representing boundaries for abnormal values will be plotted.

## **6.4.4 Tolerability Evaluation**

The tolerability of the medical product represents the degree to which overt adverse effects can be tolerated by the subject [23]. VRC 608 is the first trial of MAb114 in healthy adults. The tolerability evaluation will be mostly descriptive by nature and consist of solicited AEs that occur during the 3 days following MAb114 administration and reasons for any withdrawal or discontinuation based upon subject discomfort. This early assessment of tolerability of MAb114 will inform which parameters should be solicited or routinely assessed to further characterize the tolerability profile in a larger number of subjects.

## **6.4.5 Pharmacokinetics Analysis**

Blood samples for PK evaluations will be collected at timepoints per the Schedule of Evaluations.

**Individual Subject PK Analysis:** A non-compartmental PK analysis will be performed using Phoenix (Centara) or a similar program on the MAb114 concentration data generated from each subject. Calculated PK parameters for all groups will include: area-under-the-curve (AUC), maximum concentration (C<sub>max</sub>), time to C<sub>max</sub> (T<sub>max</sub>), clearance (CL), volume of distribution (V<sub>d</sub>), terminal elimination rate constant ( $\lambda_z$ ) and the terminal half-life (T<sub>1/2</sub>). C<sub>max</sub> and T<sub>max</sub> will be taken directly from the observed concentration-time data. The terminal slope,  $\lambda_z$ , will be determined from the log-linear portion of the curve and the T<sub>1/2</sub> calculated as  $0.693/\lambda_z$ . AUC<sub>0-C<sub>last</sub></sub> will be determined using the linear trapezoidal method, where C<sub>last</sub> is the concentration at 24 weeks after the dose. If the final sample (C<sub>last</sub>) has measurable MAb114 concentrations, the remaining AUC after the final concentration (AUC<sub>C<sub>last</sub>-inf</sub>) will be estimated as C<sub>last</sub>/ $\lambda_z$ . Data will be summarized by dose group.

**Population PK Analyses:** Population PK analyses will be performed on the MAb114 PK data following IV administration to determine compartmental PK parameters using the program NONMEM. One and two compartment PK models will be assessed. Based on prior PK studies of antibodies, it is anticipated that a two-compartment model will adequately characterize the data. The population analysis will generate estimates for initial and final volumes of distribution (V<sub>d1</sub> and V<sub>d2</sub>), inter-compartmental clearance (Q), CL and bioavailability (F). Volume of distribution at steady-state (V<sub>d<sub>ss</sub></sub>) will be calculated as the sum of V<sub>d1</sub> + V<sub>d2</sub>. Given the small subject numbers, the population PK analysis will not include an exploratory covariate analysis to assess clinical

factors as fixed effects associated with MAb114 PK parameters with the exception of dose (5 vs 25 vs 50 mg/kg) as fixed effects on CL and  $Vd_{ss}$ . The terminal half-life,  $t_{1/2\beta}$  will be determined from CL,  $Vd_1$ ,  $Vd_2$  and Q. Final model selection will be based on changes in the objective function and graphically by goodness of fit plots. The final population model will be assessed using bootstrap analysis. MAb114 dosing strategies and their ability to achieve and maintain target MAb114 concentrations will be performed using the final population PK model and Monte Carlo simulations with at least 5000 replicates.

#### 6.4.6 Interim Analyses

Preliminary PK analyses may be performed once per dose level as the data for each dose level is obtained. This will be used to inform decisions about the dose levels to be administered in studies that may begin while VRC 608 is still in progress.

### 7. PHARMACY PROCEDURES

The study groups and study product dosing schedule are shown in **Table 3**. Refer to the IB for further information about the investigational study product and administration regimen.

#### 7.1 Study Product and Administration Regimen

The study includes an investigational monoclonal antibody described as follows:

- VRC-EBOMAB092-00-AB (MAb114)

In this study, the amount of antibody needed for dosing is based on subject weight and treatment group assigned. In calculating the dose to administer, it should be assumed that the concentration of reconstituted MAb114 is 50 mg/mL, and that a volume of at least 8 mL can be withdrawn from a vial.

For example, if a subject is 80 kg, the volumes for clinical dosing per infusion would be as follows:

- If an 80 kg subject enrolled in Group 1 (5 mg/kg), 400 mg (8 mL) should be administered
- If an 80 kg subject enrolled in Group 2 (25 mg/kg), 2000 mg (40 mL) should be administered
- If an 80 kg subject enrolled in Group 3 (50 mg/kg), 4000 mg (80 mL) should be administered

Preparation of MAb114 for IV administration will require 0.9% sodium chloride, USP (normal saline). For all groups, normal saline (100 mL preferred) and weight-based amount of reconstituted MAb114 will be added to a sterile empty bag (250 mL preferred).

#### 7.2 Study Product Storage

The product label designates the long-term storage temperature as 2-8°C. The site pharmacist must promptly report any storage temperature excursions to the IND sponsor's authorized representative (Appendix II). The affected product must be quarantined in a separate area. The IND Sponsor's authorized representative will notify the site pharmacist if continued clinical use of the product is acceptable.

### 7.3 Preparation of Study Product for Administration

This section describes how the site pharmacist will prepare the study product for administration and how the clinician will administer the product.

Preparation is to be done in a limited access, biological safety cabinet with laminar flow using aseptic technique. During preparation, the pharmacist should assure that only the required vials are present in the preparation unit, and medication labels are strictly segregated to avoid mix-ups.

The following instructions apply to preparing the product for infusion:

1. Calculate the total amount of MAb114 (mg) needed based on the subject's weight and assigned dose level.
2. Remove vial(s) from storage and equilibrate to room temperature for at least 20 minutes
3. Add 7.7 mL of SWFI to each vial
4. Gently mix the vial by swirling, stopping every 30 seconds to let the vial sit on the counter for 10 seconds, until reconstitution is complete. Reconstituted product should be a clear, light yellow liquid, essentially free of visible particles. It may take up to 30 minutes to achieve a completely clear (particle free) solution. If particles are still observed in a vial, the vial should not be used for product administration.

Reconstituted or diluted drug product will be maintained for no more than 4 hours at room temperature or 24 hours at 2°-8°C prior to administration.

More information on product preparation can be found in the IB.

It is expected that each vial will be used for the 8 mL withdrawal volume (400 mg of MAb114); however, more may be withdrawn if it is possible to do so. For each IV infusion order, the subject's weight and dose level will be included in the pharmacy order.

To prepare an IV infusion, the pharmacist will fill an empty sterile bag (250 mL preferred) with normal saline (100 mL preferred), calculate the total amount of MAb114 (mg) needed, reconstitute the minimum number of vials needed to obtain the full dose and add the calculated total mg needed to the sterile bag filled with normal saline (100 mL preferred) using good pharmacy practices to maintain sterility.

An in-line filter infusion set must be used for all IV product administrations. The pharmacist should add the in-line filter to the tubing and prime the set prior to delivery to the clinical setting. In-line filters must comply with the following specifications: 1.2 micron PES (polyether sulfone) filter membrane, DEHP-free, latex-free.

The IV bag prepared by the pharmacy will include the total amount (mg) of MAb114 added to normal saline in an empty sterile bag, and an in-line filter infusion set.

Before beginning the IV administration, the clinician responsible for administration and another clinician will each check the bag label and verify the identifier, the dosage level, that the total amount of product to be administered is correct based on the subject's weight, and that the filter is in place.

The investigational study product solution will typically be administered by IV infusion for approximately 30 minutes, based on factors such as subject tolerance, using a volumetric pump. Longer infusion times will be allowed if clinically warranted.

## 7.4 Labeling of Study Product

Vials of study product will be individually labeled with the name of the material, lot number, concentration, storage instructions, Investigational Use Statement (“Limited by Federal Law to Investigational Use”), and manufacturer information.

## 7.5 Study Product Accountability

The study pharmacist will be responsible for maintaining an accurate record of the codes, inventory, and an accountability record of study product supplies. Electronic documentation as well as paper copies may be used.

## 7.6 Study Product Disposition

The empty vials and the unused portion of a vial will be discarded in a biohazard containment bag and incinerated or autoclaved after use. Any unopened vials that remain at the end of the study will be returned to the production facility or discarded at the discretion of the sponsor in accordance with policies that apply to investigational products. Partially used vials will not be administered to other subjects or used for *in vitro* experimental studies. These vials will be disposed of in accordance with institutional or pharmacy policy.

# 8. HUMAN SUBJECT PROTECTIONS AND ETHICAL OBLIGATIONS

This research study will be conducted in compliance with the protocol, International Council for Harmonisation’s Good Clinical Practice (ICH-GCP) guidance, and all applicable regulatory requirements.

## 8.1 Informed Consent

The study informed consent form (ICF) is provided in Appendix I. It describes the study product to be used and all aspects involved in protocol participation.

The PI or designee is responsible for obtaining written informed consent from each subject after adequate explanation of the aims, methods, anticipated risks and benefits of the study and before any protocol-specific procedures are conducted or the study product is administered. The AoU will be completed before the study ICF is signed.

The acquisition of informed consent will be documented in the subject’s medical records, as required by 21 CFR 312.62. The ICF will be signed and personally dated by the subject, the person who conducted the informed consent discussion, and a witness. The original signed ICF will be retained in the medical chart and a copy will be provided to the subject.

## 8.2 Risks and Benefits

### 8.2.1 Risks

MAb114: There is no prior human experience with administration of MAb114.

MAbs: Administration of MAbs may cause immune reactions such as acute anaphylaxis, serum sickness and the generation of antibodies. However, these reactions are rare and more often associated with MAbs targeted to human proteins or with the use of murine MAbs that would have

a risk of human anti-mouse antibodies [24]. In this regard, because MAb114 is targeted to a viral antigen and is a human MAb, it is expected to have a low risk of such side effects.

Typically, the side effects of MAbs are mild to moderate and may include fever, chills, rigors, nausea, vomiting, pain, headache, dizziness, shortness of breath, bronchospasm, hypotension, hypertension, pruritus, rash, urticaria, angioedema, diarrhea, tachycardia or chest pain. Clinical use of MAbs that are targeted to cytokines or antigens associated with human cells may be associated with an increased risk of infections [24]; however, this is not expected to be a risk for a MAb targeted to a viral antigen.

Published experience with human MAbs directed against the cell surface targets on lymphocytes shows that infusion of a MAb may be associated with cytokine release, causing a reaction known as cytokine release syndrome (CRS) [25]. Most infusion-related events occur within the first 24 hours after beginning administration. Severe reactions, such as anaphylaxis, angioedema, bronchospasm, hypotension and hypoxia, are infrequent and more often associated with MAbs targeted to human proteins or with non-human MAb, such as a murine MAb [24]. CRS reactions most commonly occur within the first few hours of beginning infusion and with the first MAb infusion received. This is because the cytokine release is associated with lysis of the cells targeted by the MAb and the burden of target cells is greatest at the time of the first MAb treatment. With licensed therapeutic MAbs, CRS is managed by temporarily stopping the infusion, administering histamine blockers and restarting the infusion at a slower rate [26]. Supportive treatment may also be indicated for some signs and symptoms. Delayed allergic reactions to a MAb may include a serum sickness type of reaction, which is characterized by urticaria, fever, lymph node enlargement, and joint pains. Symptoms may not appear until several days after the exposure to the MAb. This type of reaction is noted to be more common with chimeric types of MAb [24]. In general, and with due consideration of the needs dictated by individual subject symptoms and treating clinician discretion, immediate and delayed reactions to study product would be managed according to the principles of the American Academy of Allergy, Asthma, and Immunology guidelines established in the Drug Allergy: Practice Parameters (2010).

Participation in this study may limit a subject's eligibility for future MAb studies.

**Risks of Blood Drawing:** Blood drawing may cause pain and bruising and, infrequently, may cause a feeling of lightheadedness or fainting. Rarely, it may cause infection at the site where blood is taken. In this study, an IV line that can be used for blood collection may be placed in the arm and left in place for several hours on Day 0 for frequent PK blood draws. Problems from use of an IV for blood drawing are generally mild and may include pain, bruising, minor swelling or bleeding at the IV site and rarely, infection, vein irritation (phlebitis), or blood clot.

### **8.2.2 Benefits**

There are no direct benefits to subjects from study participation. Others may benefit from knowledge gained in this study that may aid in the development of EVD prevention or therapeutic methods.

### **8.3 Institutional Review Board**

A copy of the protocol, ICF, other written subject information, and any advertising material will be submitted to the IRB for written approval prior to implementation.

The investigator must submit and, where necessary, obtain approval from the IRB for all subsequent

protocol amendments and changes to the informed consent document. The investigator will notify the IRB of unanticipated problems, non-compliance, deviations from the protocol, and SAEs per IRB policy.

The investigator will be responsible for obtaining IRB approval of the annual Continuing Review throughout the duration of the study.

#### **8.4 Subject Confidentiality**

The investigator must ensure that no information identifying the subject will be released to any unauthorized party. Individual identifying information will not be included in any reports. Subjects will be identified only by coded numbers. All records will be kept confidential to the extent provided by federal, state and local law. Medical records are made available for review when required by the FDA or other authorized users, such as the study product manufacturer, only under the guidelines set by the Federal Privacy Act. Direct access includes examining, analyzing, verifying, and reproducing any records and reports that are important to the evaluation of the study. The investigator is obligated to inform the subjects that the above-named representatives will review their study-related records without violating the confidentiality of the subjects.

#### **8.5 Plan for Use and Storage of Biological Samples**

The plan for use and storage of biological samples from this protocol is as outlined as follows.

##### **8.5.1 Use of Samples, Specimens and Data**

Samples, specimens and data collected under this protocol may be used to conduct protocol-related safety and immunology evaluations, exploratory laboratory evaluations related to the biological target of the study product, exploratory laboratory evaluations related to vaccine or infectious disease research in general and for research assay validation. Genetic testing may be performed in accordance with the genetic testing information that is included in the study informed consent.

##### **8.5.2 Storage and Tracking of Blood Samples and Other Specimens**

All research samples use coded labels that only the VRC Clinic can link to the subject. Samples are stored at the VITL, Gaithersburg, MD or VRC Laboratories in Building 40, which are both secure facilities with limited access. Data will be kept in password-protected computers. Only investigators or their designees will have access to the samples and data. Samples will be tracked in the Laboratory Information Management System (LIMS) database or using another software designed for this purpose (e.g., Freezerworks or GlobalTrace).

##### **8.5.3 Disposition of Samples, Specimens and Data at Completion of the Protocol**

In the future, other investigators (both at NIH and outside) may wish to study these samples and/or data. IRB approval must be sought prior to any sharing of samples. Any clinical information shared about those samples would similarly require prior IRB approval. The research use of stored, unlinked or unidentified samples may be exempt from the need for prospective IRB review and approval. Exemption requests will be submitted in writing to the NIH Office of Human Subjects Research, which is authorized to determine whether a research activity is exempt.

At the time of protocol termination, samples will remain in the VITL facility or VRC laboratories or, after IRB approval, transferred to another repository. Regulatory oversight of the stored samples and data may be transferred to a stored samples protocol as part of the IRB-approved termination

plan. Data will be archived by the VRC in compliance with requirements for retention of research records, or after IRB and study sponsor approval, it may be either destroyed or transferred to another repository.

#### **8.5.4 Loss or Destruction of Samples, Specimens or Data**

Any loss or unanticipated destruction of samples (e.g., due to freezer malfunction) or data (e.g., misplacing a printout of data with identifiers) that compromises the scientific integrity of the study will be reported to the IRB in accordance with institutional policies. The PI will also notify the IRB if the decision is made to destroy the remaining samples.

### **8.6 Subject Identification and Enrollment**

All study activities will be carried out at the NIH CC. Study subjects will be recruited through on-site and off-site advertising done through the screening protocol, VRC 500 (NCT 01375530) (<https://clinicaltrials.gov/ct2/show/NCT01375530?term=VRC+500&rank=1>). Effort will be made to include women and minorities in proportions similar to that of the community from which they are recruited and will be limited to persons at least 18 years of age and no older than 60 years of age at enrollment.

#### **8.6.1 Participation of Children**

Children are not eligible to participate in this clinical trial because the study product has not been previously evaluated in adults. If the product is assessed as safe for further study, other protocols specifically designed for children may be conducted.

#### **8.6.2 Participation of NIH Employees**

NIH employees and members of their immediate families may participate in this protocol. The VRC clinic will follow the NIH Guidelines for the Inclusion of Employees in NIH Research Studies.

The NIH information sheet “NIH Information Sheet on Employee Research Participation.” regarding employee research participation will be distributed to all potential subjects who are NIH employees. The employee subject’s privacy and confidentiality will be preserved in accordance with NIH CC and NIAID policies. Neither participation nor refusal to participate will have an effect, either beneficial or adverse, on the subject’s employment or work situation. For NIH employee subjects, consent will be obtained by an individual who is independent of the employee’s team. If the individual obtaining consent is a co-worker to the subject, independent monitoring of the consent process will be provided through the Bioethics Consultation Service. Protocol study staff will be trained on obtaining potentially sensitive and private information from co-workers or subordinates.

### **8.7 Compensation**

Subjects will be compensated for time and inconvenience in accordance with the standards for compensation of the Clinical Research Volunteer Program. Compensation for study product administration and PK blood draws on the same day will be \$375. The compensation will be \$175 for scheduled visits that include blood draws, \$75 for clinic visits that do not include a blood draw or procedure, and \$25 for timely completion of the electronic diary.

## 8.8 Safety Monitoring

Close cooperation between the designated members of the Protocol Team will occur to evaluate and respond to individual AEs in a timely manner. The designated VRC Safety Officer will conduct a daily safety review of clinical data per VRC Standard Operating Procedures. The PSRT, comprised of the PI, Associate Investigators, Study Coordinator, Protocol Specialists, other Study Clinicians, and MO will review the summary study safety data reports on a weekly basis through 4 weeks after the last subject receives the study product and will continue to monitor the safety data reports monthly through completion of the last study visit.

## 9. ADMINISTRATIVE AND LEGAL OBLIGATIONS

### 9.1 Protocol Amendments and Study Termination

Protocol amendments may be made only with the prior approval from the IND Sponsor. Agreement from the PI and MO must be obtained for all amendments to the protocol and the informed consent document. All study amendments will be submitted to the IRB for approval.

The IND Sponsor, NIAID IRB, OHRP, study PI, and FDA reserve the right to terminate the study at any time. The PI will notify the IRB in writing of the study's completion or early termination.

### 9.2 Study Documentation and Storage

The PI will maintain a list of appropriately qualified persons to whom trial duties have been delegated.

Source documents are original documents, data, and records from which the subject's data are obtained. These include but are not limited to hospital records, clinical and office charts, laboratory and pharmacy records, microfiches, radiographs, and correspondence.

The PI and staff are responsible for maintaining a comprehensive and centralized filing system of all study-related (essential) documentation, suitable for inspection at any time by representatives from the VRC, IRB, FDA, and/or applicable regulatory authorities. Elements include:

- Subject files containing completed informed consent forms, and supporting copies of source documentation (if kept)
- Study files containing the protocol with all amendments, IBs, copies of all correspondence with the IRB and the VRC

In addition, all original source documentation must be maintained and be readily available.

All essential documentation should be retained by the institution for the same period of time required for medical records retention. The FDA requires study records to be retained for up to two years after marketing approval or refusal (21 CFR 312.62). No study document should be destroyed without prior written agreement between the VRC and the investigator. Should the investigator wish to assign the study records to another party or move them to another location, they must notify the VRC in writing of the new responsible person and/or the new location.

### **9.3 Study Monitoring, Data Collection and Data Sharing**

#### **9.3.1 Study Monitoring**

The VRC/NIAID, VRC regulatory and regulatory authority inspectors or their authorized representatives are responsible for contacting and visiting the PI for the purpose of inspecting the facilities and, upon request, inspecting the various records of the trial, provided that subject confidentiality is respected.

Site visits by study monitors will be made in accordance with the IND Sponsor policy to monitor the following: study operations, quality of data collected in the research records, accuracy and timeliness of data entered in the database, and that all process and regulatory requirements are met.

Site investigators will allow the study monitors, the IRB, and FDA to inspect study documents (e.g., consent forms, drug distribution forms, case report forms) and pertinent hospital or clinic records for confirmation of the study data.

#### **9.3.2 Data Collection**

Clinical research data will be collected in a secure electronic data management system through a contract research organization, The EMMES Corporation (Emmes) in Rockville, MD. Extracted data without patient identifiers will be sent to the PSRT for safety review and to the Protocol Statistician for statistical analysis.

#### **9.3.3 Data Sharing Plan**

Data generated in this study will be shared as de-identified data in the government-funded public repository, [www.ClinicalTrials.gov](http://www.ClinicalTrials.gov). Data may be shared prior to publication at approved public presentations or for collaborative development and will be shared at the time of publication or within 1 year of the primary completion date.

### **9.4 Language**

All written information and other material to be used by subjects and investigative staff must have vocabulary and language that are clearly understood.

### **9.5 Policy Regarding Research-Related Injuries**

The NIH CC will provide short-term medical care for any injury resulting from participation in this research. In general, the NIH, the NIH CC, or the U.S. Federal Government will provide no long-term medical care or financial compensation for research-related injuries.

**Visit Windows:**

Screening: Evaluations for eligibility must be completed with 84 days of enrollment as noted in Section 4.1.

Visit 01R and Day 0: Visit 01R may be done on the same day as Day 0. Visit 01R = day of enrollment. Day 0 = day of product administration. Day 0 is preferably scheduled within 14 days after enrollment at Visit 01R, but may be scheduled up to 28 days after enrollment. Day 0 evaluations prior to MAb114 administration are the baseline for assessing subsequent AEs.

EOI: End of Infusion blood draw visits, defined by minutes or hours after an infusion, are relative to the exact time of the end of infusion (EOI). The exact time of start (T0), EOI and each PK draw are recorded to ensure accurate PK analysis. **It is preferable to draw PKs as close to target time as possible.**

Visit 02A: up to 10 minutes post EOI    Visits 02B, 02C: ± 10 minutes    Visit 02D: -2 hours    Visits 03, 04: ± 6 hours    Visit 05: ± 2 days

**Footnotes:**

<sup>1</sup> Day 0=day of product administration. Day 0 is preferably scheduled within 14 days after enrollment at Visit 01R, but may be scheduled up to 28 days after enrollment.

<sup>2</sup> Screening: All screening evaluations including laboratory tests, medical history and complete physical exam must be completed within 84 days of enrollment.

<sup>3</sup> Physical exam: Screening includes complete physical exam with vital signs, height and weight. Day 0 physical exam includes vital signs (blood pressure, temperature and pulse) and weight (used for ordering the study product which is based on a “mg/kg” dose). At other visits if medically indicated, a targeted exam is performed. Otherwise only blood pressure, pulse and temperature are required.

<sup>4</sup> Medical history: Screening, 01R and Day 0 evaluations include a complete medical history to evaluate eligibility criteria as defined in Section 4.1. At other visits, an interim medical history will be completed.

<sup>5</sup> Concomitant medications: Concomitant medications must be entered in the database at enrollment and updated as required in Section 4.2.7.

<sup>6</sup> Study product administration: Group 1 subjects will receive a single infusion of 5 mg/kg IV, Group 2 subjects will receive a single infusion of 25 mg/kg IV, and Group 3 subjects will receive a single infusion of 50 mg/kg IV.

<sup>7</sup> Administration Site Evaluation: Clinicians will assess the product administration site on Days 1, 2 and 7 and record any findings in the database. Any signs or symptoms unresolved by Day 7 should continue to be evaluated until resolved.

<sup>8</sup> Reactogenicity Diary: Subjects will begin to record 3-day systemic reactogenicity after study product administration as noted in Section 4.2.4. Clinicians will review with the subject at a minimum on Days 1, 2 and 7. If any reported reactogenicity is unresolved by Day 3, it will continue to be reviewed with the subject until resolved which may require an interim phone contact. Data from the diary will be recorded in the database as noted in Section 4.2.4.

<sup>9</sup> Pregnancy test and pregnancy prevention counseling are required at visits as indicated for women of reproductive potential. Negative pregnancy test results must be confirmed for women of reproductive potential prior to MAb114 administration.

<sup>†</sup> Anti-drug antibodies (ADA) will be assessed from serum samples taken at baseline, four weeks post-infusion, and 24 weeks post-infusion at the final protocol visit. Banked serum from any study visit may also be used for ADA assessment as indicated from observations in an individual subject prompting suspicion of ADA development, such as a precipitous drop in PK levels.

**Footnotes:**

<sup>1</sup> Physical exam: If medically indicated, a targeted exam is performed. Otherwise only blood pressure, pulse and temperature are required.

<sup>2</sup> Pregnancy test and pregnancy prevention counseling are required at visits as indicated for women of reproductive potential.

<sup>3</sup> Human leukocyte antigen (HLA) type blood sample: If the HLA type within 2 years is not available in the medical record, a blood sample will be collected once. HLA type may also be obtained from a frozen sample.

<sup>4</sup> PK samples: PK draws may be cancelled at Visits 15 and 16 if results from Visit 14 are available and show no detectable MAb114, however these visits will still be required.

<sup>†</sup> ADA assessed from serum samples as indicated. Banked serum from any study visit may also be used for ADA assessment.

## Appendix IV: Table For Grading Severity Of Adverse Events

The U.S. Department of Health and Human Services, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Division of AIDS. Division of AIDS (DAIDS) Table for Grading the Severity of Adult and Pediatric Adverse Events, Corrected Version 2.1. [July 2017] will be used in this study. The table is available at the following link: <https://rsc.tech-res.com/docs/default-source/safety/daidsgradingcorrectedv21.pdf>

The Table will be used as posted at the link above with the following exemptions:

- Weight loss will be recorded as an adverse event only if it is considered deleterious to the participant's health.
- For severity grading of the solicited bruising parameter at the product administration site, the definitions based on size of the largest diameter and listed for the "Injection Site Erythema or Redness" will be used. The severity grade definition for "Bruising" provided under the Dermatologic Clinical Conditions will be used only for unsolicited AEs involving bruising at other body locations.
- Subclinical CMP results for sodium, potassium, chloride, bicarbonate, BUN, and glucose will not be considered an AE unless grade 2 or greater.
- Creatinine changes will be graded on the basis of the upper limit of normal provided by the grading table and not change from baseline.
- Creatinine clearance changes will be graded according to ml/min provided by the grading table and not change from baseline.
